## CONTENTS OF VOL. II.

---

### CHAPTER XIII.

Resumption of narrative — Case of kidnapping — Religious persecution — Vice and immorality of Europeans — Expedition into the Chamlù Bel Mountains — Village of Keiras — Interesting ruin — Ali's "dam" — Rifle competition — The plain of Art Ova — Waylaying stags — Feat of horsemanship — Nature of soil — Monster ant-hill — Yaila of Emir Oghloo — The Salep Plant — Fight with dogs — Return to Tocat.. .. PAGE 1

### CHAPTER XIV.

Career, cruelties, and tragical end of Icherly Oghloo — Corrupt practices of Government officials — Unsuccessful bear-hunt — The Mufti's country house — Erection of chapel and school 21

### CHAPTER XV.

Trip to Sivas — Robbers' Hill — Adventure of a missionary — Highest point of the Chamlù Bel — The Star River — Village of Karghùn — "New room" of Halil the Kiahaya — Vultures' nests — Skin of wild mountain goat — Plateau of Melkon — Plain of Sivas — Arrival at Sivas — Petrified shells — Fossils — Tertiary formations of Asia Minor.. .. 38

### CHAPTER XVI.

Description of Sivas — Unwholesome air — Coal-hunting — Start back to Tocat — Tufaceous rock — View of the Star Mountain — Village of Sarù Yeri — Ascending the Star Mountain — Heaps of boulders — The Summit — Remains of a fort — Ancient road — View from the summit — Strabo's description of the mountain — Descent — Return to Tocat.. .. 57

**CHAPTER XVII.**

<u>Circassian music — Bishop Keshish Oghloo — Dedication of new chapel — Start for overland journey — Praying places — Villages of Seungut Keuy and Pazar Keuy — Fountain of Chermook — Farm of Haji Boghos Agha — Kùzûlbash labourers — Swamps of the Kaz Ova — A pair of somersaults — Village of Yeghin Musulman — Spirits of Turkish saints — Village of Chiflik — Village of Euren .. .. .</u>	<u>PAGE 78</u>
---	----------------

**CHAPTER XVIII.**

<u>Turkish village of Beyordoo — Flattering reception — First sight of camels — Hot spring and bath — Village of Keuhneh — Travelling Koords — Town of Yozghat — Change of muleteers — Valley of Kamishjy Boghaz — Pass of Devrend Boghaz — Ruins of the temple and city of Pterium .. .. .</u>	<u>94</u>
---	-----------

**CHAPTER XIX.**

<u>Detailed description of the ruins of Pterium — Forts — Subterranean passage — Carved rocks — Hypothesis respecting their meaning — Arrival at Euyuk .. .. .</u>	<u>112</u>
--	------------

**CHAPTER XX.**

<u>Plan and description of the remains of an ancient building at Euyuk — Sphinxes — Rock carvings — Conjectures respecting the origin and design of the building .. .. .</u>	<u>129</u>
--	------------

**CHAPTER XXI.**

<u>Town of Sungurlu — "Arpalanmish" — Orchard encampment — Protestant Armenians — Village and mosque of Aghajû Koyoonoo — Females pounding wheat — Corn-pits — Salt-pans — Villages of Kara Bekir, Yaghliû, and Izeddin — Without a guide — Advantages and disadvantages of an official guard — Single and double-humped camels — Cotton culture — Mode of providing fuel — Construction of chimneys — Presentation of relic .. .. .</u>	<u>149</u>
--	------------

**CHAPTER XXII.**

Village of Yozghat — Antique marbles — Angora goats — Village of Orta Keuy — Manure fuel — Feast on apples — Description of Angora — Catholic Armenians — Religious persecution — History of Angora — Deserted houses — Armenian monastery and cemetery — List of Europeans buried there — Persecution of Protestants — Peculiar atmospheric phenomena — The Protestants of Angora — Religious service — A converted Turk — Ruins of Castle — Temple of Augustus .. .. . PAGE 169

**CHAPTER XXIII.**

Continuation of journey — Villages of Balù Kooyoomjoo and Chiflik — Petrified shells — Turkmen summer-houses — Sakaria river — Villages of Orta Keuy and Hortoo — Lazy muleteers — Black sienite — Village of Sivri Hissar — Dyeing of Skins — Trials of the Christian population — Physical features — Village of Balahissar — Ruins of ancient buildings — The Angora goat — Ruins of castle and theatre — Sculptures — Night-travelling — Tents of nomad Turkmen — Turkmen village of Baghlùja .. .. . 198

**CHAPTER XXIV.**

The inhabitants of Baghlùja — Ancient sculptures — Bad conduct of the muleteers — Wandering without a guide — Wildness of the country — Volcanic region — Village of Seïdiler — Natural tower — Town of Eski Karahissar — Wells — Arrival at Afion Karahissar — Position of the town — More trouble with servants — Horse-hiring — A reforming Caïmacam — Cultivation of the poppy — The Whirling Dervishes — Ancient monuments and sculptures — Turkish village of Balmamood — The broad-tailed sheep — Four-horned sheep .. .. . 218

**CHAPTER XXV.**

Departure from Balmamood — New servants and companions — Forest on fire — Ride in the dark — Village of Chiflik — The Sabbath rest — Manufacture of opium — Bactrian Camel —

Village of Islam Keuy — Valonea oaks — Village of Bozghoor — Town of Ooshak — Manufacture of carpets — Geological formation — Village of Geunch — A robbers' trap — Village of Muzuk — River Hermus — Former residence of a Dereh Bey — Bridge over the Hermus — Arrival at Suriyeh .. PAGE 245

## CHAPTER XXVI.

Plateau of lava — The Ship Gorge — Composition of the soil — Town of Koola — Old volcano — Kind reception — Public wells — Mounted guard — Volcano of Kara Devlit — Cavak Dereh Pass — Plain of Philadelphia — Mountain range of Tmolus — Village of Derasily — The Kooza Chay — Salihly — Village politicians — Turkish pictures — Ruins of Sardis — Town of Cassaba — Water supply — Roman aqueduct — Buildings — Tameness of the storks and ring-doves — Articles of commerce — Nif Chay — Mount Sipylus — View of the Plain and Gulf of Smyrna — Home again .. .. 270

## CHAPTER XXVII.

Visit to the Statue of Niobe — Region of Mount Sipylus — Valley of Nymphio; abode of the "Divine Nymphs" — Distant view of the stone image — Erroneous impressions of travellers concerning it — Appearance of the statue on a close view — Dimensions and description — The "tears of Niobe" — Tradition respecting the Statue — Evidence of ancient writers — Suggested explanation — Agreement with the Greek legend — Visit to the Monument of Sesostris — Difficult ascent — Herodotus' description — Return to Nymphio — Unsuccessful attempt at exaction — Palace of the Byzantine Emperors .. .. 300

# TRAVELS IN ASIA MINOR.

---

## CHAPTER XIII.

Resumption of narrative—Case of kidnapping—Religious persecution—Vice and immorality of Europeans—Expedition into the Chamliu Bel Mountains—Village of Keiras—Interesting ruin—Ali's "dam"—Rifle competition—The plain of Art Ova—Waylaying stags—Feat of horsemanship—Nature of soil—Monster ant-hill—Yaïla of Emir Oghloo—The Salep Plant—Fight with dogs—Return to Tocat.

WE now resume the narrative of our visit at Tocat, which has met with a long interruption for the purpose of initiating the reader not only into the history of missionary labours in this place, but also into the general character and condition of the people of Asia Minor. We left off the story of our travels upon our arrival at Tocat, from Constantinople and Samsoon, after a six days' overland journey by way of Amasia. Here are a few extracts from my Journal:—

*May 20th.*—Several of the chief Armenians of the town have applied to me to use my influence in a case of not unfrequent occurrence in this land. There is an Armenian girl of fifteen, whose widowed mother has a very doubtful reputation, and whose own conduct has not heretofore been above blame. This girl has

fallen in love with a young Turk, and she has expressed her intention to turn Mohammedan for the purpose of marrying him. Thereupon she was kidnapped from her mother's house, and with the consent of the latter, by our old friend Haji Mardiros Agha, now the first *chorbajy* \* of the Armenians, who keeps her in confinement; but as she persists in her determination to renounce her religion, he will be compelled to let her go. The Armenians, clergy and people, have employed every means in their power in order to induce this girl not to abjure the religion of her fathers. They have worked upon her conscience and her fears of hell and purgatory; they have promised to marry her to a handsome young Christian, with plenty of money for her dowry; but all in vain. She doubtless knows that they do not intend to keep their word. On the other hand, she does not know, poor thing, that her "beau ideal" is quite likely to divorce her in six months, or less. But "love is blind." And now these people come to me, hoping that I may be able to induce the Turkish authorities not to allow this marriage to take place. I told them it was wholly out of my power. I added that this occurrence was the natural result of their mode of bringing up their children, and of the example they set them; and for my own part I should not much

\* *Chorbajy* means, literally, a soup-maker; it is the only title which Turks will consent to give to Christians in the room of Mr., keeping for their own exclusive use those of Agha, Effendi, &c. Though the word *chorbajy* cannot properly be said to retain its original meaning, it would yet be a mortal offence to apply it to a Turk.

regret to see all such people embrace a religion whose licentious tenets accord with their own immoral lives.

22nd.—The following case has lately come under my notice. It illustrates the kind of persecution now prevalent all over the empire toward those whose minds have become too much enlightened any longer to practise the superstitious observances of Eastern Christianity, as well as the manner in which the clergy succeed in enforcing obedience to the antiquated precepts of their Church. When we left this place in 1861 to visit America, there was here a young Greek, twenty years of age, who was a member of the Evangelical Church. Finding he could not make a living by labouring at his trade as a saddle-maker, he had just begun to learn the carpenter's business, which was much more promising; but finding no one in Tocat willing to teach him, he went to Sivas and bound himself as an apprentice to a skilful Protestant carpenter. Having served his apprenticeship he returned to Tocat, and remained five months absolutely without work, owing to his being a Protestant and to the prohibitions of the clergy. Compelled by starvation, he outwardly conformed to the Greek Church, and has found plenty of work ever since. He now openly declares that he has not changed his views in the least, and proclaims himself a Protestant; but he is obliged to go to the Greek church, and to keep away from the Evangelical preaching: moreover his relatives hope to secure his complete reformation by

marrying him to a pretty young girl who has no leaven of truth in her heart.

23rd.—It seems strange to find that Europeans, brought up under more or less of Christian influence and amid an atmosphere of virtue and morality, so frequently become vicious and immoral as soon as they lose the restraints of home. We have had here, for several years past, a few persons who were considered very respectable in Europe and at Constantinople, but who have while here made the name of *Frank* a by-word for lewdness and immorality. The only way in which we can mitigate the reproach in such cases, is to point out the fact that these people are Roman Catholics, and their manners only correspond to those of the Armeno-Catholic priests here, who are their Father-confessors, and whose reputations are such that no respectable man of their own religion will allow his wife to confess to them unless he is present. It is, however, difficult to know what course to pursue toward these strangers: we owe them the rites of hospitality; but in thus doing our duty the people deem us their friends, and think we approve of their lives.

30th.—The young men of our party have been begging for an expedition into the Chamlù Bel Mountains close by, in the hope of coming across some stag, or other beast of the forest. The season is altogether too far gone. The nomadic tribes are already far up on the mountain, with their herds, flocks, and tents, and they must have frightened away the poor game into the

most inaccessible recesses. Yet, as this region has never been explored by a European, and the work upon the chapel and school can proceed for the present without my superintendence, I have decided upon an absence of nearly a week. Every preparation being joyfully made, and taking as guide our old friend Ali, the Turkish mountain sportsman of bear and stag celebrity, we started this morning at 5.45. Our direction was south, through the beautiful valley where lies the usual winter road to Sivas by the Art Ova and Yeni Khan. This charming valley, scarcely a mile in width, is extremely fertile, being filled with gardens, orchards, and cultivated fields of barley, Indian corn, and tobacco, with melon and cucumber patches; it is watered by a stream flowing through the centre, under a continuous bower of trees and climbing vines. The mountains on both sides rise to a height of full a thousand feet, and appear quite as fertile and productive, for the most part, as the valley itself. We reached the Turkish village of Keiras at 6.45. It is a collection of miserable stone huts with flat roofs, indicating wretchedness in man amid the rich productions of nature. It possesses a flour-mill; walnut-trees are abundant, and vegetation profuse. A portion of the water of this stream is turned off at the head of the valley into a canal which runs along the western slope, and supplies most of the city by means of pipes running down from the canal to the houses. The eastern portion of Tocat is similarly supplied with a canal, fed by a fine

spring issuing from under a great rock high up on the hills which bound the valley eastward. The rest of the water in the valley stream feeds several mills, and is used in the copper foundry; but there is not enough to keep the establishment at work during the summer months. At 7 the valley became very narrow—a mere gorge, with the stream at the bottom, and scarcely room on its margin for the road. On the opposite bank lies a natural cave, in the perpendicular limestone, where the wild pigeons make their nests. Here the strata of the rock offer the most extraordinary contorsions, showing that the region has been subjected to powerful volcanic influences; this is further proved by the occurrence of trap rock. There are several flour-mills here, at short distances from each other, owing to the rapid inclination of the ground. The very last in the gorge is occupied by a Protestant miller, whom I had not yet seen, and who, spying us from far, joyfully ran out to meet us. His demonstrations of gladness and affection appeared somewhat unusual to my companions. At this place a narrow path climbs the hills to the right, leading to Greek villages in that direction. At 7:30 we reached the bridge at the head of the valley, and crossing it, continued straight on. A road here runs off to the left, taking a south-easterly course, and leading into the mountains; some people go by it to Sivas, and we returned this way from our present trip. There is near this road, and barely fifteen minutes' ride from the bridge, a very interesting ruin which I visited

several years ago, and which I will now stop a moment to describe. It crowns an isolated limestone rock, some 500 yards long and 100 wide, and has an elevation of about 200 feet in its highest part. The hillock has an irregular rectangular form, with perpendicular and inaccessible faces on the south-west, north-west, and north-east. On the latter is cut out a plain tomb, which it would require a very long ladder to reach: it is open, and must be empty. The summit of the hillock appears to have been occupied as the area of a castle or small fortified town, for one can yet easily trace the remains of a strong wall along the only side which is rendered accessible by the sloping surface; but the ruins within are so completely destroyed that no conjecture can now be formed of the nature of the buildings once standing there. There is, however, just such a tunnel as I have described in speaking of the ancient fortifications of Amasia and Tocat; it points down deep into the rock, at an angle of  $45^{\circ}$ , and the steps are in a better state of preservation than those of the others. This fortification defended an important pass out of Pontus into Cappadocia, at the time when that kingdom still maintained its independence; just as the fortress of Tocat seems originally to have merely been a fort to hold the important pass it commands, for it is not probable there was any town there as long as Comnena Pontica flourished, distant two leagues only up the Iris.

At 9.15 we reached the "*dam*" of Ali, our guide. There was once a village here, but it is in ruins. Ali

owns these fields, and keeps a "dam" or stable in repair, in which he stays with his cattle at the time of ploughing and harvest. These fields being at a considerable elevation on the mountain, and moreover isolated, with the primeval forest close by, his crops are very often devoured by the wild boars and stags, and even bears not unfrequently come down in the night to get a meal. Being a Muslem, he cannot eat the former, and kills them in pure self-defence, though he sometimes succeeds in selling one to some Christian, who carries it off, if he can reach it before the sharp-scented vultures have feasted upon it. I once came here in search of game at the season when meat is scarce in town; I well remember that we hauled a wild boar, we had killed, up into a tree, out of the reach of the wolves and foxes; but when my messenger arrived with a horse to carry it away, he found that the vultures had already eaten so much of it that the remainder was not worth removing. Since then I have followed the practice of dragging our game home upon the snow, which is easily done, Tocat being situated upon a much lower level. We stopped here by a fine stream of water to eat breakfast. While thus engaged, the men who had charge of our horses began to brag of their shooting powers and the quality of their guns; so they set up a mark on the other side of the ravine, at a distance of 150 yards. The boasters missed it, but Ali hit it at the first shot, and we were all greatly amused to see a large hare start up from a bush only a couple of yards from the mark

they had been trying to hit. Our would-be great shots had no end of jokes cracked upon them in consequence; it was said their bullets instinctively sought the hare, &c. I had one of Sharp's breech-loading rifles with me, and challenges were made to try it against the rifle of one of the men. I consented to do so, provided the mark were placed at least 300 yards off; and the result of my firing was such that the other party refused to take his turn. The top of the hill we soon afterwards reached was formerly occupied by a single guard-house, but the place has now been given up to a number of Circassian families. The air is good, but we saw very few signs of industry; only a few fields were cultivated by them. As they show no inclination to break up the fallow ground, their only resource, when the allowance now paid them by the Government comes to an end, will be to take forcible possession of the fields of their Christian neighbours, as they have begun to do elsewhere; or to levy black-mail, for which their position upon this main road is admirably adapted. Their fields are not fenced off with stone walls, like those of other people; they are protected by a slight fence, made mostly of wild cypress or fir sticks. There were several graves separated by the road from the village, and surrounded by similar fences, only more solidly constructed. The only monuments raised within these enclosures are stout sticks planted upright, one at the head and another at the foot of the graves. It is said that these Circassians do little as yet for their

support. They are mostly slaveholders, and their slaves are expected to work for them; they have hitherto been supported to some extent by the Government, but more by the sale of their slaves' children, both boys and girls, which are purchased by Muslems.

The rock about here is sandstone. After leaving the village we went down to a fine stream and fountain, shaded by a large tree. We reached Finezeh at 1:30 P.M. This is a Kùzùlbash village of fifteen houses, in a very dilapidated and ruinous condition. We pitched our tent on the grassy lawn, and were soon stretched upon our bearskins, sipping the never-failing and ever-welcome cup of tea. The plain of Art Ova spreads out southward, growing constantly wider, and covered with unbroken fields of grain or pastures for cattle. The villages, mostly Armenian, seem from this point to be thickly scattered over it, and in several of them the church is a prominent building, rendered visible from a great distance by being whitewashed. I have repeatedly crossed this plain in several directions, as well as skirted it on its western edge. It is fertile everywhere, but apt to be a little swampy in the centre; though very productive now, its soil might easily be turned to much better account. The usual road to Sivas crosses it from north to south near the western edge, and going right over the Chamlà Bel, passes by Yeni Khan, a large village composed of two distinct portions, the one Turkish, and the other Christian, separated by a small stream and bridge. The

Christian village is, as usual, the more prosperous of the two.

Looking round from our tent-door in front of Finezeh, in a direction opposite to that of the Art Ova, we could see Dinar, a Kùzùlbash village, lying near the edge of the plain to the north-east of us, and about two miles distant. On the east of us, and at about the same distance, are hills, which we visited, of hard red conglomerate, containing many pebbles of red and blue jasper. The plain contains gypsum near its edge under the soil, and it is dug out and carried to Tocat. In the evening Ali came to tell us that he intended to spend the night on the edge of a small salt-marsh or spring near by, for the purpose of watching for stags. Game has now retreated to the depths of the forests, both on account of the flocks which are leaving the plains and going up the mountains, and because the flies are beginning to trouble them. But there are isolated springs of brackish or salt water, called *Choorak*, which these animals seek with great avidity, and frequent, even in the immediate neighbourhood of villages, as in the present case; the native sportsmen kill more stags by waylaying them there than in any other way. The *Choorak* in this instance was hardly two miles from the village. The young men were extremely anxious to go, but I would not consent on account of the cold nights at this elevation. Ali went about midnight. He hid in some bushes on the edge of the spring, and towards dawn, having fallen asleep, he was

suddenly awakened by a sort of grunt a few steps from him, followed by the sound of retreating footsteps. We examined the ground in the morning, and found that a good-sized buck had come within a few yards of him, and then beat a hasty retreat across the field, where his tracks were deeply impressed in the soft soil. Ali would not have been caught napping but for the fatigues of the preceding day.

*Tuesday, 31st.*—Struck tent and started at 6·15. Wasted some time in trying to get possession of a fine specimen of the black stork, which was enjoying a *gourmand's* breakfast of frogs in the stream. Crossed over a hillock into a charming little valley filled with orchards of fruit-trees and fields of maize, and watered by a gushing stream which descends from the mountain to the E.N.E. Flowers were blooming in profusion on every side, and we could readily have yielded to the temptation to stop here awhile. Went up the valley along a well-shaded path until we reached, at 7·15, a flour-mill built up the stream; we found that we were proceeding in a wrong direction, and, crossing the river, we turned up the opposite hill and took a steep and rocky road, leading right up the mountain, through forests of pine, wild cypress, and fir, with a precipitous ravine upon our right, at the bottom of which we heard, and occasionally caught a glimpse of a mountain-torrent tumbling over the rocks. The scenery was thoroughly Alpine and truly enchanting. The tongues of all were loosened; one after another of the party sang

his favourite ditty, or his "song of home," and finally came a grand chorus. One of the party had fully made up his mind that he could never learn to ride on horseback, and to prove his assertion he was wont to relate various narrow escapes and actual tumbles, some of which were sufficiently ludicrous. Not content with this, he had exhibited his prowess the day before on the Kùzùl Enish; for he rode a steed whose full, luxuriant tail trailed upon the ground, while the mane, reaching almost as low, nearly hid the head and face of the animal. Our knight, anxious to secure the greatest amount of comfort, had arranged himself upon the top of soft cushions, scientifically strapped, with a complete arrangement of saddle-bags, cloaks, changes of garments, gun in its case, and pistols, and was, moreover, fully rigged after the most approved style of high-topped boots, silver spurs, and broad wooden stirrups, "à l'Américaine." We were all progressing with due order and solemnity, gazing with admiration at the ingenuity and ready resources of our knight, when, as luck would have it, a fly of the "worser" sort broke upon the quiet of the scene by stinging the otherwise gentle steed to the quick. In an instant the whole scene was changed; our knight disappeared in a clond of dust and horse-hair, with here and there a protruding limb at various angles of elevation, while from the chaotic mass issued half-smothered cries of "Whoa, whoa — stop him — whoa!" Several jumped off their horses and rushed to the rescue; quiet soon returned;

our knight emerged safe and sound, but half over on one side, desperately holding on to the front and back of the saddle. The adventure now became the theme of comment and song; a parody of a popular ballad was soon manufactured, and peal after peal of laughter echoed through the mountain-gorge. I must however add, for the comfort of future aspirants to the noble art of riding, that this same knight soon came to be so much at home in the saddle, that he *took* to sewing while riding, and actually *made* a fine cap-cover of the "Havelock" pattern, which I hope he will long preserve as a reminiscence of our rides upon the Chamlù Bel.

Our direction was eastward. We rose higher and still higher on the rocky path, and our pack-horse dropped his load, thus delaying us nearly half an hour. The rock, which had all along been a red conglomerate, turned, soon after we began our steep ascent, to a hard crystalline stone, resembling trap, but of a lighter colour. I first considered it of volcanic origin; but upon more careful and extensive examination found it to be greenish shales hardened, probably by volcanic agency, so as frequently to resemble trap on the one hand, and serpentine on the other. The whole mountain appears to be composed of this rock, with the occasional occurrence of a little limestone, and it extends as far as the red sandstone and tertiary formations of the Sivas basin. Its resemblance to serpentine in places would lead me to suspect a closer affinity

between the two rocks than is generally acknowledged. My former experience of the fertility of soil formed from argillaceous shales was confirmed upon this mountain. For it is an unbroken forest, with artificial clearings, with the exception of a few circumscribed patches where the limestone occurs, and which are mostly barren. The natural beauties of the vegetable world were truly exhilarating. The pines were in full bloom, but the blossoms seemed shorter and rounder than usual. There was not much underbrush, and the occasional small clearings were covered with tall grass. After reaching a certain height we rode mostly upon an even level until we came to the *Yaila* of Emir Oghloo; *yaila* means a feeding-ground for cattle. It is a plateau at a great elevation on the mountain, cleared of forest, of an undulating surface, and covered with abundant grass, where the people of some of the villages below come up to spend several weeks of the warmest summer weather, bringing their flocks with them to give them better feeding and save them from the flies, while at the same time they clear their own persons of village vermin. The plateau is of a circular form, with a northern exposure; it has the summit of Kurju Dagħ, one of the Chamlù Bel peaks, at its back on the south. There are two fine springs of water here, by the side of one of which still stand the booths occupied by the villagers during their residence. We preferred the vicinity of the other, "for obvious reasons," and pitched our tent under a spreading pine. We found a variety

of mountain flowers, and, while wandering about, came upon a monster ant-hill, the largest any of us had seen in Asia Minor; it was built around the decayed stump of a pine-tree, and was made of dry pine-leaves. The occupants were the common black ants, and the mound measured 3 feet in height, and the same in diameter. Its size probably adapts it to the snows which lie long on this mountain. We had, however, as yet found no snow anywhere, nor was it visible on any of the heights in view. The little we met with upon this trip lay in a deep ravine under thick pine-trees; we came upon it the following day. These *yailas* each belong to the people of particular villages, whether by common consent or otherwise, I could not ascertain. They generally bear the name of the village to which they belong. Thus the *yaila* of Emir Oghloo is the summer grazing place of the people of the village of Emir Oghloo. They live there in booths, which they repair when they go up. Hence villages are often found completely deserted by their inhabitants, who have gone to their *yailas*, or summer residences. This, however, occurs only when the occupation of the people is chiefly pastoral. In some cases a portion of the inhabitants go to the mountain, while others remain to watch the neighbouring crops. The nomadic Kurds have no *yailas*, properly speaking. They begin to move early, and get to the mountain plateaus by the time the warm weather begins. But they always live in moveable tents, and they are not permitted to intrude upon the village *yailas*.

Our sportsmen had left us early on our ascent up the mountain, and had gone round in various directions, "beating" the different ravines: they met us at the *yaila* in the afternoon, and reported that there was not a track of deer to be seen anywhere. The game had doubtless moved farther on, this portion of the mountain having already been invaded by woodcutters and herdsmen, whose foot-marks were but too evident. We therefore decided to move on without loss of time. We struck tent accordingly and started off at 5.45, going south over the crest of the mountain, and descending on the other side through primeval pines into a deep ravine. We had not gone far before we came upon fresh tracks of stags; those of wild boars occurred at almost every step. Having reached the bottom of the ravine, we went up on the other side to the *yaila* of Geuveshmeh, lying in a position very similar and parallel to that of Emir Oghloo. Ali had left us before going into the stream, and had taken to the right, following the fresh tracks of the deer. We reached the *yaila* just in time to hear the report of his gun, and to see two fine antlered stags running up the hill at the top of their speed. They had unfortunately got the wind of the sportsman, and they were already too far when Ali saw them, and sent them a random and ineffectual shot. Our *yaila* is a fine undulating plateau, covered with tall grass, and furnished with good springs of water. No booths remain in sight. The evening being very cold, and gnats abundant, we

dragged together several pine-trees which, having long been cut, were very dry and full of pitch, and lighted four great fires, which were soon roaring, and burned vigorously throughout the night.

*June 1st.*—We were very warm in the tent, but there being no room for our faithful Carabed, he dared not lie down on account of the cold, and kept on his feet all night. The other men slept by the fires. In the morning we divided our forces into several parties, and all started off at five, taking different directions, to look after the long-sought game. I went with Ali upon the tracks of the deer he had missed the evening before. We were at first enveloped in a thick fog, but managed to make our way through the dripping trees and wet grass, meeting many tracks, some of last night. We also found a fresh bear's track going up a bank; the wild boars' tracks were very abundant. Went over much ground, mostly through the forest, and up and down steep ravines, and breakfasted by the cold brook on bread and cold chicken. Returned to the tent at 10, empty handed, and found that the rest, like ourselves, reported only tracks. We concluded that last night's shot, and our blazing fires, had pushed the game farther back into the mountains; indeed, the fresh marks of flocks and herds were already seen among those of game, so that we had doubtless only come upon the very last of these. The sun had now come out quite hot, and we made our preparations to leave for home. This place is said to lie ten hours from Tocat by the

route we have pursued; there is a more direct and shorter road over the mountains, by which we propose to return; we shall save one hour, in spite of all the irregularities of the ground.

*June 2nd.*—Saw for the first time the *Salep* plant, which is now in bloom. The root is about an inch in diameter, and irregularly globular; it is much used throughout Turkey made into a drink, being hawked about hot in every city early in the morning during the winter. There are regular salep hunters, who collect it in the mountains at certain seasons of the year; it is dried and reduced to powder, and makes a mucilaginous and sweetish drink, which is deemed beneficial to sore throats.

I had stopped to pull up salep roots, when the young men of the party, impatient to get on, pushed forward and proceeded across a barren *yaila* where several Koordish tents were pitched close to the road. We heard barking and voices, and, hastening forward, found our companions had been set upon by a number of splendid watch dogs, which paid no attention to the whips but appeared determined to fight. One of the largest bit my boy Willie in the foot, his teeth going through the stout leather. Seeing their owners indifferent, and having even heard some of them exciting and setting the dogs on, I hastened forward, and in the thickest of the "mêlée" shot one of the finest animals in the leg. The people then poured out of their tents, and showered imprecations upon us; but they were all women and old men; had the young men

been at home, we could not have got away without trouble. Ali and the other natives soon came up and resorted to the usual device of making up a story that I was a great Consul from somewhere; so the matter was "quashed." All the people who own dogs in this country think they have a right to allow or even encourage the creatures to worry passers by, as much as they like; for if a dog is killed they may claim a fabulous price for it from the nearest authorities. As we had two dogs with us, we were liable to continual annoyance, especially on entering a town. In some cases, when out upon the road, we frightened away the dogs by running our horses at them, or even firing a random pistol shot. But we finally adopted the expedient of tying a long and powerful leather thong to the end of our whips, and as soon as any dog came in sight, we took the aggressive. Our horses became so used to it, that they ran at a dog as soon as they saw him; and our dogs learned to take shelter among the horses; we found that no dog, however savage, would stand more than one well-laid blow from such a whip.

After three hours' riding we passed under the ancient fortress already described, which lay on our right, and reached the bridge at 5:30, when we came to the road by which we had started on this trip. On reaching Tocat we had the gratification to find a bulky mail-bag waiting for us; my own share consisted of sixteen letters, besides newspapers.

## CHAPTER XIV.

Career, cruelties, and tragical end of Icherly Oghloo—Corrupt practices of Government officials—Unsuccessful bear-hunt—The Mufti's country house—Erection of chapel and school.

**T**OCAT, *June 11th.*—I learned to-day the tragical close of the infamous career of Icherly Oghloo, the noted chief of banditti, who has for many years past been the terror of this whole region. It is truly worth recording as characteristic of the state of the country. He was quite a young man, not over twenty-five at the time of his death, a fine-looking fellow, extremely powerful and athletic, but brutal and often the worse for liquor. He belonged to a wealthy and highly respectable Turkish family of Herek, the chief town in the Tash Ova. The Turks of the Tash Ova are noted for their fanatical hatred of Christians and Jews, as well as for their spirit of independence, and the Government have never succeeded in destroying their old habit of constantly carrying arms upon their persons; even boys of ten and twelve have a loaded pistol in their belts; nor are they loth to use them upon the slightest provocation, whether real or imagi-

nary, particularly towards the unarmed Rayahs. Icherly Oghloo has had it all his own way in that entire district for many years past; he has not allowed the Government officers to collect the taxes, and has made it up to the people by levying contributions at his option. He had a band of eighty to one hundred men, perfectly devoted to him and skilful in the use of arms, with whom he roamed about, stopping travellers, and punishing with death the slightest resistance. At the same time he usually resided in his own fine house in Herek, and outward appearances were kept up by his frequenting the Mejlis or Provincial Council, of which he had been appointed a member on the usual principle of the Turkish Government of courting the goodwill of offenders too strong to be punished. The Muslems generally had a high opinion of him; for he professed to be a bigot himself, and exercised his heartless cruelty mostly upon Christians. Several Pashas had been sent with troops against him, but he had always succeeded in either avoiding or bribing them. He had for some time past felt unusual security from the fact that the post of Pasha of Sivas, upon whom depends the district of the Tash Ova, was held by his own uncle, who favoured him in secret; this had given him greater boldness, and the country was groaning under his yoke. Among the many well-authenticated deeds of cruelty related of him, the following will serve as a specimen of the monster. He was married, during our residence in Tocat, to a young girl of very

respectable family, and well do we remember the rejoicings and feastings on the occasion. Yet he soon got tired of her, and kept a paramour, who, wearied out by his brutality, succeeded in escaping to parts unknown. He heard that she was secreted in a Greek village; this was not true, but he suddenly made his appearance in the place with several of his band, during the absence of the men, who had gone to reap some fields situated high on the mountain. He immediately ordered a search in every house, and as the person he sought could not be found, he wreaked his vengeance upon the defenceless Greek women by ordering his bandits to seize every one of them, and in his presence horribly mutilate them! Their husbands and brothers vowed revenge, and obtaining from Constantinople a firman authorizing them to kill the miscreant wherever found, they had for a whole year watched and waylaid him for the purpose; but he kept so thoroughly upon his guard, that they finally gave up the attempt.

In 1861 he came one day to Tocat, though perfectly aware that he was an outlaw. He very coolly called upon the Governor, Mejlis, and principal people of the town, who dared not receive him otherwise than with marked attention. The whole military force of the place amounted to about a dozen *zabtiehs* or police officers, and it was known that his band held all the roads leading out of the town, and were determined to pillage it or even set it on fire upon the slightest

offence to their chief. An Armenian friend brought him to me and introduced him, hinting that in such a land, it is well to be on good terms with such people; I could not appreciate the force of the argument, but, yielding to curiosity, received him with attention and had a long conversation with him. He seemed stupefied by drink, his eyes looking dull and heavy, and it was difficult to make him talk. He finally, however, awoke from his lethargy, and closely questioned me respecting the possibility of escaping out of the country. He had with him a young man whose eye was sharp and restless, and who is reported to be a first-rate marksman. They both wore suits of scarlet broad cloth richly embroidered with gold thread, and were thoroughly armed. He tried hard to get possession of my Colt's revolver, but I declined parting with it. I proposed to sketch his portrait; he sharply asked, "Do you intend to send it to Constantinople?" I said, "No, I shall send it to our friends in America, in order to let them see what fine-looking men there are out here." He was evidently pleased with the compliment, and was immediately upon his feet, ready to be sketched. When he was taking his leave, I asked him for his cane as a memento of his visit, and he readily gave it; it is a club of hard wood, ornamented with an inscription bearing his name and commending him to the Divine favour; there is no doubt it has seen service.

Icherly Oghloo finding himself constantly watched

and waylaid by men who sought to avenge their wrongs, resolved upon a pilgrimage to Mecca. He therefore, as is customary in such cases, sent out criers to inform all who had money claims upon him, to come and get their pay. He was riding one afternoon in the plain of Niksar, when his companion, the young man we had seen with him at Tocat, laughingly observed that, now he was going to be a Hajj, he must reform somewhat. He did not relish the remark. They stopped that night at a village hut, and while his companions were lying asleep around the fire, he drew his pistol, and placing the end of the barrel upon the young man's temple, blew out his brains. He never went to Mecca.

Upon the accession of the new Sultan, Abdool-Aziz, he talked of surrendering to the authorities in the hope of being treated with greater leniency ; but before he accomplished his purpose, if he ever really contemplated it, he was apprehended in the following manner. A new Pasha having been appointed to Sivas, he charged with the business an old experienced *zabtieh* who proposed to employ craft, assuring the Pasha that force alone would be unavailing. He went to Herek with some documents which needed the signature of the Mejlis of that place, of which Icherly Oghloo was still a member ; at the same time, he engaged the services of a number of resolute Circassians, settled near by, who were *accidentally* to be present in the Council Chamber at the same moment, armed as usual, under pretence of a claim which the Council had already

refused to recognise. The Council met, but Icherly Oghloo was in his house. The *zabtieh* explained his business, and the members of the Mejlis there present put their seals to the documents as desired. Icherly Oghloo was sent for; he came in hurriedly, alone and unarmed, and sat down near the fire-place. By this time the Circassians had broached their matter, and receiving an unfavourable answer, they began to argue and became noisy. The *zabtieh* made them a sign, and they fell at once upon Icherly Oghloo; he immediately saw through the business, and snatching the heavy tongs, dealt a hard blow with it upon the *zabtieh's* head; but the Circassians quickly secured him, and the rest of the Mejlis and attendants, supposing they were all equally the objects of the Circassians' anger, fled at the top of their speed. The bandit was brought here, and Yahia Bey, the Koordish chief, conveyed him to Sivas, where he was confined in prison for more than a year. He frequently attempted to escape, but was unsuccessful; a servant long watched for him near the prison with a horse ready saddled; but the man was apprehended, fined 8000 piastres, and allowed to go only upon giving a security that he would not be seen there again. The Mejlis got a great deal of money from the culprit, by promising to exert themselves in his favour. In the meanwhile he was tried on many severe charges; but he managed through outside friends to obtain an acquittal each time by means of bribes. Finally, the widow of a relation of

his own, whom he had killed, arrived from Constantinople with stringent orders that justice should be done her, and she demanded his blood. As she persisted in refusing the commutation money (30,000 piastres, or 280*l.* sterling) he was sentenced to die. The fact of his condemnation was concealed from him, for the authorities thought so powerful a man could not be brought to execution by force, even after his long and painful confinement; they therefore informed him that he must be taken to the Meïdan or largest square of the city of Sivas, where his pardon and acquittal would be read to the public. The account of his execution was given us by a truthful friend of many years' standing, who was himself an eye-witness. He stated that so great a fear of him was entertained, that whenever he had to be taken to the court, during the trial, he was bound by a strong rope, each end of which was held by four stout *zabtiehs*, just like a wild bull. On the day of his execution, he was conducted in the same manner from the public prison to the Pasha's Palace, where, instead of his pardon or acquittal, he heard his sentence of death read, and then they led him to the Meïdan, followed by a great crowd. When he had reached a small bridge on the way, he sat a few moments upon the parapet, saying he had no strength left. As he sat there, a man came up to him and reproached him with having burned alive all his sheep one by one in the fire-place. They reached the public square, which was packed with an immense crowd. He

stood in the midst of a vacant space kept clear by the police. He wore a handsome fur; his hands were riveted together with heavy iron bolts. His arms were bound with strong ropes, the ends of which were held by *zabtiehs* on either side at the distance of several feet. The Judge then came forward on horseback. A fearful silence ensued, during which the sentence of death was pronounced, and could be distinctly heard by the crowd of spectators. Icherly Oghloo's wife then advancing, kissed the Judge's foot and begged for mercy; but he spurned her from him, and is said to have kicked her in the face. The order was then given to put an end to the scene. No one had been found willing to perform the office of executioner, though large sums had been offered. One of his fellow prisoners, however, consented to do it on condition of his own crime being forgiven. Icherly Oghloo was then pushed from behind and thrown down upon his knees; they tried to take off his pelisse from him, but he would not consent, and they only turned it back, baring his neck. The executioner, completely disguised, and wearing the costume of a Circassian, in order to screen him from private revenge, lifting his sword, struck the culprit on the back of the neck; he fell forward upon his face, and the executioner, laying the sharp edge of the blade upon the neck of the prostrate man, pressed it down with his foot, and completely severed the head from the trunk. Thus ended the career of a man noted for his heartless cruelty, and

his thirst for human blood, yet at an early age, probably not more than twenty-five.

13th.—We received a call from a young Frenchman, a graduate from one of the best Imperial colleges in France, who has been sent here by the Porte to examine the accounts of the Copper Foundry, respecting which doubts have long been entertained at the capital. It is ever thus; Turks always rob one another, and the Government most of all, and whenever any confidential or conscientious duty is to be performed they have to find some European who is willing to undertake it, but he must be one who has not been long enough in the country to become as corrupt or worse than themselves. It is notorious however that such a man, though he secure the respect of all, cannot retain his place unless he give up his honesty; for those who are interested in plundering unite to intrigue and get rid of him, because he gives them no chance. I fear this young man won't stay here long, for he seems bent upon a conscientious discharge of his duty. He says he has already discovered thefts to the amount of several thousand pounds, though he has only been a fortnight in the place, and is quite ignorant of the language. Speaking of items, he mentioned as a specimen that there are eleven horses in all, employed in the establishment, and yet the Government is charged 68 combs for them every year! There are five carts, whose cost *new* is 5*l.* a-piece, making an aggregate of 25*l.* Yet the Government

•

is charged 85*l.* a year for the repairs of these five carts!

17*th.*—We had several times been told that bears were unusually numerous this year in the neighbourhood; they are reported to have laid waste the vineyards that are planted on the western slopes of the valley near by, not more than half-an-hour's walk from our house. The owners of these vineyards have repeatedly sent to us to beg that we would come out and kill or frighten away these disagreeable customers, as they have been compelled to abandon their vineyards. A few days ago one of these bears met with an accident which put an end to his career and to further mischief: it is supposed that he was trying to get at some honey in hives lying upon a high rock at the Kemer, and that he fell from a great height and was killed. As the young men of our party were itching for bear experience, we finally promised to go and watch for Bruin as soon as the moon was high enough; and now Ali came and told us that three bears had made their appearance in a vineyard and eaten off all the cherries from several trees. So R—— and I went to Ali's house at 6 P.M.; we had with us a French gunsmith, M. Grégoire, from the neighbourhood of Marseilles,—very fond of sport, but who, like R——, had not yet encountered anything bigger than hares and partridges. M. Grégoire wore a white linen blouse, and over it a regular game-bag, while a long sword-like hunting knife hung from his belt. We started up the steep

mountain side under the guidance of Ali's six-foot beardless son; the father having gone over to a neighbour to help to carry home, in an araba, a poor cow that had accidentally broken her leg. On reaching a considerable height we stopped and sat down to breathe and enjoy the fine panorama spread out before us. The hills on our side of the valley were in the shade; but those opposite were brilliantly illuminated by the setting sun. The valley was fast filling with shadows which grew longer every moment, and the town and opposite hills looked truly fine from this spot. We marched on through several vineyards until we reached two miserable huts built of mud bricks, one of which was occupied by a Turkish family. We went into the empty hut, and the owner on first spying us through the dusk evidently disliked our looks; but he soon recognised our honest-faced M. Grégoire, and received us cordially. Our tall Bekir now lighted a fire in the crumbling chimney, and we made ourselves comfortable and discussed our provisions. Unfortunately no one had thought of taking a tea-pot, for which M. Grégoire's hunting bag would have made a capital nest; so, after many "pourparlers," the *harem* in the other hut furnished us their whole "batterie de cuisine," every variety of cooking and feeding dish they owned, which mustered as follows:—(1) a long-handled coffee-pot, 2 inches high and an inch and a half broad; (2) a brass cup, without handle, 6 inches by 4; (3) a copper pan 2 inches high and 1 foot across; and (4) a brass non-

descript, 8 inches by 10. Oh! the tyrannical demands of modern civilization! All this fuss for a single cup of tea! But then we were unanimously of opinion that, in this chilly mountain air, that cup of tea *was* worth the fuss. After consultation, the feat was accomplished as follows: we boiled our water in No. 3, and used No. 1 as a dipper; we made our tea in No. 2, and drank it by turns in No. 4; demolishing at the same time twice as many cherries as the bear would have eaten had he come in our stead. Several French songs were repeated or improvised, chiefly at the expense of M. Grégoire's delightfully cool summer blouse, his convenient havresack, destined to carry all the bears he would kill, and his spit-like sword, upon which he might turn the steaks before the fire. At this stage in the proceedings a man came in and reported that he had been in the cherry-orchard which the bear had visited last night, had lighted a great fire, and had then run away; and he was congratulating himself upon thus saving at once his remaining cherries and his skin. We sent him back to put out the fire, and might then have slept all the time till nearly one o'clock, had not the place been already too thickly tenanted by extremely lively and ravenous occupants.

At one o'clock after midnight we were groping our way through vineyards and orchards, until we reached a point higher up the mountain and entered a field which occupies a narrow gorge through which the bears have to come down from the rocky heights where

they spend the day. They could avoid us only by clambering over the rocks on either side of the gorge. We found half-a-dozen trees from which the bears had taken cherries the last night or two; this position was such as completely to command the pass. Three of us hid ourselves in a hole under one of these trees, so that our heads alone appeared above the ground; and even these were hidden by the trunk of the tree; M. Grégoire with his sword and fowling-piece went to the right; our party seemed to be a little apprehensive about which side he would take in case of a general *mêlée* with Bruin. In half-an-hour the moon sank behind the hills. Then the darkness seemed very great, and it took us some time to be able to distinguish anything in it. Ali was soon fast asleep, and snored so loud, I was obliged to punch him every few minutes, lest he should scare away the game. It was bitterly cold, and we could not stir to shake out our limbs. At 2 a hare hopped about in front of us; another nearly stumbled on the other party; M. Grégoire might have spitted him through with his sword had he not slept most of the time. Finally at 3 we concluded that Bruin was taking his supper somewhere else; we went over the hills into orchards and vineyards where he would be likely to call, and looked round for him, listening to every sound that broke the silence of the night. As we stealthily crept along by the side of a narrow gorge the watchmen on the top of the hill took us for a company of bears, fired off a pistol, and shouted

lustily after us. We passed by the tent of the chief watchman and reproached him for not keeping his word to meet us, and deserting us when we might, with the aid of his experience, have met with some measure of success. He apologised by saying that the *mufti* was with his family in his country house near by, and he was so frightened by the report of the bear's approach that he would not allow him to go away for a single night, and, moreover, kept several men firing pistols all night around the house and bonfires burning. We reached home about 5 A.M., and this is our adventure *about* Bruin, and "how we *didn't* do it."

This was not, however, our only attempt to make the personal acquaintance of Master Bruin. The frightened *mufti* had fled to town the very next day after our mountain vigils. He entreated us to do our utmost in order to rid the neighbourhood of so disagreeable a visitor, and offered us the use of his country house and of the cherries and other fruit we might be so fortunate as to save from the clutches of the bears. So we removed from town for the purpose of a little change, and spent several days rusticated, doing full justice to the poor *mufti's* white, black, and red cherries, which we found "worthy of our distinguished consideration." We indeed quite sympathized with the predilections of the much abused animal, who only deserved to be considered a gentleman of taste. The hills on the east of the valley are called Kemer, and those on this side Kemal. The *mufti's* house is

probably the best building of the kind anywhere around here. It is an old style Turkish house, and shows many of the peculiarities they often exhibit. We give a sketch of the front of this dwelling, with its cool tank

The Mufti's country-house near Iocat.

and fountain, shaded by cherry trees. Soon after our arrival at the place we received a call from the chief watchman, or *bekji*, of the Kemal District; he is an old man, tall, bony, strong, but terribly out of shape, and with only one sound eye, which is never more than half open; it must be pretty sharp though, if but half of what is reported about him be true. He was accompanied by his two daughters-in-law, and three grandchildren, the eldest of whom seemed so much at home

in the place, that, without prelude of any sort, he at once stripped and jumped into the tank of water for a swim.

We spent the night of the 24th watching on a hill-side, but to no purpose. And again, two of us spent the night of the 26th under a shed commanding a view of several trees which the bear had visited the night before, leaving the marks of his claws upon the trunks, and several broken branches, to betray his thefts. But it was again in vain. About 1 o'clock a hare passed within reach of my hand, hotly pursued by a weazel. The latter, having missed his prey, stood some time in full sight, evidently disappointed. Though we failed of accomplishing our ostensible object, we found in this delightful spot the change and healthy atmosphere we sought. I often went to town on business; we rambled over the hills, picked and pressed flowers; and the young men shot small game to their hearts' content. The last night we watched for bears was spent by Ali and the chief *bekji* in scouring the whole region; and yet we found in the morning that Bruin had visited a vineyard only a hundred yards from the house we occupied, and had frightened the owner almost out of his senses. Our experience of him, therefore, fully sustains the reputation which he enjoys for cunning and highly developed organs of smell and hearing.

During all this time the erection of the chapel and school was rapidly advancing. It had indeed progressed

so satisfactorily, and the native preacher and the deacon of the church were so active and economical in their superintendence of the work, that I resolved to devote a few days to visiting Sivas, and the summit of Star Mountain,—the latter being an object I had long purposed to accomplish, but had heretofore been prevented by pressing engagements. This trip will be described in the following chapters.

## CHAPTER XV.

Trip to Sivas — Robbers' Hill — Adventure of a missionary — Highest point of the Chamliû Bel — The Star River — Village of Karghan — "New room" of Halil the Kiahaya — Vultures' nests — Skin of wild mountain goat — Plateau of Melekon — Plain of Sivas — Arrival at Sivas — Petrified shells — Fossils — Tertiary formations of Asia Minor.

**J**UNE 30th. *Thursday.*—We left Tocat at 6 A.M., taking the summer road to Sivas, and going through the narrow gorge on the east side of the town, which becomes the bed of a powerful torrent during a heavy rain; this we reached in five minutes after leaving the last houses of the town. Went up the steep ascent, with the song of the partridge upon the craggy rocks around us. In the winter these birds come down to the road to feed, and even enter the gardens on that side of the town. We ascended a narrow valley for about an hour, following and often crossing a small stream of cold water, until we turned to the left to climb what we have long called the Robbers' Hill, on account of a trying adventure which occurred here to our missionary physician, Dr. Jewett, and his companions, and which I will briefly relate. A small party of travellers had come from Samsoon to Tocat;

it was at the time of the Crimean War. The party consisted of an Englishman going to Diarbekir to purchase horses for the British Government, and supposed, though incorrectly, to be carrying plenty of money ; with him was travelling the notorious braggadocio, Carabed Agha, distinguished by the euphonious name of Zobaboornoo, or shovel-nosed, who very foolishly boasted all the way, in the most unguarded manner, that his belt was full of gold pieces. He actually carried some 200*l.* sterling belonging to different parties. They spent a night with us at Tocat, intending to leave the next morning for Sivas ; but the Englishman felt too much fatigued to proceed, and as Dr. Jewett had to go that very day to Sivas, on professional business, he took the Englishman's place, and was, as a natural consequence, mistaken for him. The report that travellers, well stocked with money, were journeying almost unprotected, had brought together a number of Koords who are always ready to make the most of such a chance, and they chose as the best spot for attack the top of the ascent we had now reached, hiding themselves behind the rocks and among the trees. The ascent is long and steep. The robbers doubtless had their scouts out, and were notified of the travellers' approach. They rode up carelessly at a brisk pace, and in a body, and as their blown horses, now advancing at a slower rate, had nearly reached the top, several men sprang out in front of them from behind the rocks, while others all around presented the muzzles of their guns with a

shout. Resistance would have been impossible; for they were but three besides the *surujy* or guide, and only one of them, a *zabtieh*, was armed; while the robbers were a dozen. Before they could look round and comprehend their situation, they were hurled to the ground, bound, and dragged to a secluded hollow near by, where they were robbed of all their valuables. The banditti were sorely disappointed to find that, instead of an Englishman with saddle-bags full of guineas they had only got hold of a doctor with a few surgical instruments; they were so angry that they pretended to hold a consultation about killing their prisoners, which frightened the *zabtieh* almost out of his wits. They, however, only kept them until nightfall and then let them go on to Sivas. The authorities of that place made this affair an excuse for sending troops into several Koordish villages to rob and plunder to their hearts' content; but the victims of the robbery above described got precious little redress.

Soon after leaving the Robbers' Pass, the vegetation, which had been very abundant, presenting on every side primeval forests, the resort of the stag and the roebuck, began to be less profuse, as passing over a hill we entered a narrow rocky valley running S.S.E., and followed the course of a stream which flows in the same direction. This is the first water we had yet met which runs towards the Kuzul Urmak (Halys) on the south, all we had yet seen flowing north to the Iris. We reached the Bekjilik or guard-house at 10.30. The

house itself lies off to the right of the road across a swamp.

Travellers stop by the roadside under a booth near a spring of water, and are accommodated with coffee prepared by the guards. It is at this place that the Muslem convert K—— was overtaken by his pursuers; but he threw them off their guard, secreted himself until night, and went back to Tocat, reaching my house after midnight. We gave him refreshments, effectually disguised him, and sent him through by-roads to Samsoon and Constantinople—hiding during the day, and travelling at night. Had his enemies caught him they would have prevented the preparation and publication of some of the most effective attacks ever made upon Mohammedism.

We got into our saddles at 12:15. We went mostly up hill, through scattered pines, and ascending a steep declivity, reached at 1 the highest point of the Chamlù Bel upon this road, which I found by barometer to be 5512 feet above the sea. This part of the mountain is considered very dangerous to travellers, in case of a snow storm, on account of the drifts which obliterate the road, and the cold blasts which blow over the slopes on both sides of the pass, as well as at the pass itself. Nearly every year we hear of people buried in the snow, and a number of rude graves at the southern foot of the mountain affords ocular demonstration of the fact. Solitary travellers are also occasionally set upon and devoured by packs of hungry wolves. The view

is extensive and grand. The Star Mountain rises like a cone: it is 3000 feet higher than this level, but rises from much lower ground. Our descent was rapid, and occupied 40 minutes. This side of the mountain is nearly destitute of trees. We passed the cemetery at the foot, and forded the stream called Yavash Akan Soo, "the slowly-flowing water." It is a tributary of the Yildiz Soo, the Star River. Being interested in the question of the rise and flow of the Star River, I made inquiries of the people of the different villages which lie about here, and which I visited at various periods. The result of my investigations is that the name of Star River is claimed, and apparently with equal justice, by two streams, both of which rise far up the sides of the Star Mountain, and not distant from each other. One of them has its origin in abundant springs which flow from the north side; the other rises in the eastern declivity. The former takes a circuit round, passing near the villages of Yoosoof Oghloo and Boodookhtoon, and flows through the plain on the west side of Karghùn. The latter encircles one half of the Star Mountain, flowing near its southern foot by the Star Village, and then taking its course westward it unites with the northern stream, after which junction they flow southward to the Halys. I have concluded to retain the names of Star River as the denomination of both these streams, and to distinguish them as the Northern and Southern Branches. At 3.15 crossed the northern branch of the Star River over a wooden bridge;

cattle, the roof of the whole being levelled even with the hill at the back of the house—the name of “room” has come to be the usual appellation for a house. Our friend directed us, on reaching Karghùn, to inquire for the “new room” of Halil the Kiahaya, or head man of the village. It was readily found, and was probably the best in the place. Its roof was made of the trunks of poplar trees, a foot thick, upon which had been laid planks of oak covered with clay. The whole was supported by a row of five stout wooden pillars, with a balustrade between, dividing off a portion of the room for stores or servants. The fire-place, cupboards, and the rafter or shelf running around the room, were unusually clean and nice; but the earthen floor made no deceptive promises of a good night’s rest. Our attentive host furnished us with two low tables, covered with everything the village could afford. We lounged about till sunset in front of the “new room,” carefully avoiding the holes in the roof of the next house below us, which formed the piazza of ours, lest we should fall through and be landed upon the horns of the cattle in the stable beneath. The young men gave a variety to our fare by shooting large numbers of the starlings which fluttered all about, unconscious of danger. An observation with the barometer indicated 4830 feet as the height of Karghùn.

*Friday, July 1st.*—We rose at 3, but could not get under way before 5. The villagers here are not very early risers, for a wonder, and we found it difficult to

rouse anybody to get us barley for our horses. At 7:30 stopped at a booth erected by the guards upon the road side, where coffee is offered to travellers. The rocks here stand upright, leaving but a narrow space between them and the river. They are perforated with holes of considerable size at an inaccessible height, which are used as nests by vultures. One of these holes was formerly tenanted by a species of hawk which was highly esteemed in the days of falconry, and the birds used often to be robbed of their young. They seem to have become discouraged, and have abandoned the place. A short stick is still standing across the entrance, placed for the purpose of making the spot more attractive to the bird by giving it a perching pole. It may, however, have been put there only to render a visit to the nest practicable, as it must be extremely difficult under the most favourable circumstances, owing to the great height.

While seated in the booth I noticed a skin spread upon the ground belonging to some animal we had never seen. Upon inquiry, I found it to be the skin of a wild mountain goat, killed in the neighbourhood two years before. This was the first I had ever seen, having never been able to obtain anything but the horns; and I esteemed myself fortunate to be able to make the acquisition. I had heard in Tocat of a large male skin being presented to the Sheikh of the Whirling Dervishes, for the purpose of saying his prayers upon it; for the Turks believe that the *carpet*

has much to do with the efficacy of one's prayers, and the skins of the stag, the roebuck, and the wild goat, enjoy the highest reputation in that respect. The one now in my possession would seem to be a female, and to have its summer coat. The hair is short and stiff, fawn all over, except underneath and within the thighs, where it is of a dirty white. There is a dark red line along the back, extending through the tail; the hair of the neck is curly. The legs are also dark red. The whole length from the back of the head to the root of the tail is 3 feet 5 inches; length of the tail 6 inches.\*

Willie here shot some very pretty little birds, which we agreed to call red-headed sparrows, from their general resemblance to the common sparrow; their habits also appeared very similar.

Soon after this the Star River turns to the right, following the course of the valley; we part company for the last time, for it now deviates considerably to the right, falling into the Halys below Sivas. I was thus glad to have had another opportunity fully to ascertain the precise course of this river, interesting on account of its connection with the mountain of that name, and Strabo's historical sketch of both. It now only remained to ascend the mountain and ascertain the correctness of the statements of the natives, who declare that the ruins of a castle exist on the top,

\* Since writing the above, I have seen a male specimen of this animal in the Zoological Garden at Amsterdam, together with one of the *monflon*, or wild sheep.

and that a fine spring of water issues not far from the summit. Were this correct, we should have a very striking corroboration of Strabo's account of the stronghold where Mithridates kept his treasures, which he states was destroyed and the hoarded wealth seized by the indomitable perseverance and energy of the Romans. It was with great pleasure therefore, that, having now obtained in the vicinity of the mountain all the information we needed, we anticipated going up to the summit on our return from Sivas.

After parting with the Star River, we crossed over a hill through a narrow cut in basalt rock. Looking around us from this point, we found a crest of basalt, forming a pretty regular circle about two miles in diameter, the central area and surface being smooth. Were it an ancient crater it would not present a different appearance, and the Star River seemed to enter it at one side, and to come out again at the nearly opposite point. At 10:50 we came upon the Plateau of Melekon, a barren waste, covered with calcined rock. There is at first, *i.e.* at the north end, a little conglomerate, and then a very little red sandstone; but it soon changes to limestone, which, from its position, I take to be secondary, lying between the old red sandstone and the earlier tertiary of the Sivas plain; but it has become hard as flint by exposure to the air and sun. This effect upon stone comparatively soft I have not unfrequently observed in Asia Minor. In the present case the upper surface alone is thus hard, for when you come to the

broken cliffs you find all beneath comparatively soft and easily broken. Melekon has no water, and every attempt to cultivate portions of it has failed. Ruins attest the efforts of Government and individuals to erect places of shelter for travellers; for in winter many perish here, overtaken by snow storms, and losing their way over this broad and even surface; and many are frozen to death by chilling winds coming down from the mountains on the north. I believe Melekon is generally dreaded by travellers more than crossing the Chamlù Bel. The attempt to obtain water from wells is also said to have failed, probably owing to the vicinity of the valley of the Kùzùl Urmiak, which lies several hundred feet lower, draining it of rain water; and there are fine springs at the bottom of the cliffs which form the boundary of the plateau. We reached the nearest edge at 12·25, and looked down the precipice into the narrow valley which leads to the plain of Sivas. This valley, about a mile in width, runs nearly north and south; both its upper extremity and its two sides are formed by nearly perpendicular cliffs, which constitute the broken sides of the Melekon formation; they present a limestone and somewhat chalky surface, and constitute a cut into the plateau. The length of the valley is about six miles, and the cliffs on either side about abruptly on the plain, into which it emerges. A powerful stream of fine water pours out at the head of the valley, apparently constituting the drainage of the plateau and accounting for its barrenness. This stream rushes down

the valley, spreading fertility wherever its goes, and working several mills; it passes through the town of Sivas, furnishing it with good water in abundance, turning its mills and watering its gardens; and a considerable stream is left to flow into the Halys. The road down from the plateau is cut along the face of the cliff; and at 12.40 we reached a gushing fountain near the bottom, when there was an immediate rush of men, horses and dogs, to get the first draught of water; my own steed drank so long and so resolutely, that I began to think I had met with the same accident as Baron Munchausen, and succeeded in getting away only by leaping into the saddle and making use of spurs and and bridle. The rock of the cliffs presents very much the appearance of chalk, but it is harder. It easily crumbles and decomposes when exposed to the influence of the atmosphere at an elevated angle. The layers are nearly horizontal, the inclination being toward the south-east, indicating a moving force on the north-west. It is possible that this force may have come from the source which formed the old crater, already pointed out. In the valley, I found in one place considerable masses of tufaceous rock, sometimes highly crystalline; but these do not seem to be extensive. The bottom of the valley is generally homogeneous, fossils have been found in it, and in the cliffs some distance down, some of which are in my possession. They were given me by one of my old Tocati students, who followed with unusual interest my course

of lectures on geology, and has since attended somewhat to the subject.

At 1:30 we entered the Plain of Sivas. The first portion of it stands considerably higher than the level of the alluvium, and it is formed of undulating hills. It was probably at one time the bottom of the lake or inland sea, whose waves beat against the limestone cliffs I have described. When the water sank, the limits of the lake became circumscribed to the present broad alluvial surface, until running out completely, they only left the Halys, which is fed from the skies and runs unimpeded to the sea. Near the place where the valley opens into the plain is a flour mill, where traces of lignite may be seen in horizontal layers in the banks which have been worn by the stream. Passed a short distance from the Armenian convent, the residence of the Bishop of Sivas; it contains several fine buildings, and the whole area is well protected by a stone wall. Just before entering the town we came upon a camp of Turkish troops, occupying the ground which overlooks it. Everything appeared clean and in good order. We passed by the country seat of the Pasha, built high upon the rising ground on the outskirts of the town, and went directly on to our friends who had been anticipating our arrival.

*Saturday, July 2nd.*—A former pupil of mine, now residing at Tocat, had informed me of the existence of petrified shells of a tertiary character in a lateral valley on the south side of the Plain of Sivas, and we

started this morning at 6 to look for the locality, several friends accompanying us. There are gardens for vegetables on the outskirts of the town; the cold is too intense at this elevation (about 4500 feet above the sea), to allow fruit to come to maturity; the trees themselves, indeed, are mostly killed by the long and severe frosts; the only varieties we saw about the town were willows and poplars; there are a few others of stunted growth in protected situations in the gardens. We crossed the Halys, the Kùzûl Urmak, or Red River, upon a substantial but narrow stone bridge of twelve arches, an Abassidian structure, furnished with a good parapet. Instead of being built straight across the river, it makes a bend of nearly  $40^{\circ}$  in the centre, so as to present an angle to the current, which, however, strikes it obliquely. There is a similar bridge eight miles down the stream, which is considerably injured. We found a good deal of timber, mostly beams, lying in the river and upon its banks. It is cut in the mountains up the stream, and sent down the current to be used for building purposes; some of it is employed as fuel. Most of the fuel, however, is cut on the mountains, often several days' journey from Sivas, and is brought down upon sledges as soon as the snow allows; this wood is pine and fir. But the natives do not use much fuel for warming purposes. They build their houses tight, with very thick walls, often four feet, mostly of mud bricks dried in the sun; and the roofs are terraced with a heavy layer of clay. In the villages

the walls are of stone, and the houses partly under ground; the occupants are moreover warmed by the cattle, from whom they are separated only by a slight partition or a railing; and as wood is more easily obtained, the constant fire in the chimney ventilates the place, for the foul air has no other means of escape when the door is closed. The hills we passed over are mostly formed of gypsum, often finely crystalline, but easily crumbling to dust. Wherever watercourses have cut through the gypsum, red sandstone appeared to underlie it. We descended into a small plain, which has salt swamps in the centre, and is called "Bin Geul," the thousand lakes; salt is here obtained by evaporation; it is carried to Sivas to market. Salt is obtained in the same way in the Oozoon Yaïla, a long plain, lying to the south, and separated from the Sivas plain by gypsum hills. These two sources supply the whole of this region as far as Kharpoot. The salt marshes in Bin Geul also point to the existence at one time of an inland sea or salt lake, which we have already suggested as being proved by the fossil remains found in the adjacent rocks. We left the swamps upon our right. Feeding in the marshy ground were large flocks of golden ducks, which often rose in the air and sent forth their peculiar harsh note. There were also many eagles, but we could not perceive what attracted them to the place. We reached, at 7.45, the small Armenian village of Bin Geul, situated on the other side of the plain, and upon rising ground. It contains about sixty

houses and a church. The stones in the walls are mostly formed of deposits of sand and pebbles, with broken pieces of shells, doubtless formed on the shores of a lake of considerable size, or subject to the occasional flow of torrents. These stones are very compact, and so adhesive as to be broken with difficulty with a heavy hammer. We came, at 8.45, upon a considerable river running from left to right among high hills. As we could only see gypsum around us, we were beginning to despair of finding the object of our search, and had already proceeded some distance back when I discovered we had passed by the spot without noticing it. Right by the roadside, and running parallel to it, lay an elliptical hillock, 200 yards in length, 50 in breadth, and about 50 feet high, which contained so many shells as to seem formed of nothing else. This was doubtless a bank, where succeeding generations had lived and died, and left their tenements to form the basis of the houses of their posterity; so that now these shells are alone found here, mingled with coral, and the soil itself has disappeared. The shells are not petrified or altered, but preserved in their natural condition, except that they have lost their colour. We succeeded after much search in finding a little rock, which was marly and probably formed of minuter shells. I opened the only oyster we found entire, the valves of all the rest having parted. I found it filled with hardened sand. Most of the shells were oysters, though we picked in all some twenty different species of uni-

valves. We found several different species of coral, some of them very fine, but all colourless; the coral was very abundant, and may have formed the foundation of the bank.

I believe that what has already been described respecting the Sivas basin will make it sufficiently apparent that it is a tertiary deposit, though probably one of the older ones. Many have heretofore supposed that this region belonged to the coal formation, and great expectations have been entertained of the discovery and working of coal mines. I confess I never could enter into that view, from the few facts I had been able to collect upon the subject. All attempts hitherto made to find coal have proved abortive, and the little that has been picked up from mere traces is bad lignite. I have, however, in my possession almost pure bitumen in small particles, which is probably too rare to prove of any use. I must add to the facts now related respecting the Sivas basin, that there is a prominent hill rising from the middle of the Sivas plain, and half an hour to the east of the town, composed of a stone sufficiently hard for building purposes. Slabs are obtained thence for paving courts and sidewalks. The stone appears to be sand united by lime, and corresponds to the fossiliferous rock described on page 49. I have been told that a number of interesting fossils have been found in the rock taken from this hill, and among the rest the head of a horned animal. My efforts to obtain a sight of this valuable relic have been

unavailing. It may possibly be an ammonite. The only specimen I have been able to procure is the spine and ribs of some small fish.

A few words may not come amiss here upon the tertiary formations of the Peninsula of Asia Minor. It is said that such a formation exists in the vicinity of Cæsarea and Mount Argæus, but I never have visited the place. The tertiary beds of the northern point of Rhodes are highly interesting. They consist of sand raised to a height of about 200 feet above the sea, and slightly inclined inland. The sand is soft, and the weather and rains cut it down in steep banks, which reveal the secrets of the ancient seas. The shells are extremely varied, for I picked up 150 species in a short time, and many of them preserve their colours. This fact, and the species to which they belong, at once indicate the formation to be one of the most recent tertiary. But they are purely marine deposits. Those of the Plain of Troy probably belong to the same period in time, but they more nearly resemble the tertiary of the Paris basin, with which they may be contemporaneous. I have never had an opportunity to visit and examine this locality, but some fishermen have brought me the tooth of a mastodon, which they had picked up near the ruins of Troas; and the formation appears to extend to the vicinity of Ren Keuy. Leaving the bank of fossil shell and coral, we turned back the way we had come, paying closer attention to the rocks adjacent to this interesting deposit. The rock in the neighbourhood of

Bin Guel seems very much like the substratum of our bank, only harder and without shells. It also lies higher. It is slightly inclined to the south-west, and as the result of all my observations, I conclude that it underlies the immense deposits of gypsum which form the hill country on the south and south-east of the Sivas plain. The fossiliferous rocks on the north and south sides of the plain probably belong to one and the same set of layers, and once extended all the way across, but have been broken up and washed away in the centre, where we now find a lower level and alluvium. The cliff in the centre of the plain would then be a remnant of this formation, being a connecting link between the rocks on the north and those on the south of the plain. However this may be, it appears sufficiently clear that the red sandstone underlies the whole. It has a slight inclination to the south-east on the south side of the plain, as we had seen on the other side, still indicating a moving force on the north-west, which is the nearest point of the Chamlù Bel. There are several questions respecting which I confess I am much embarrassed; but whatever theory is adopted, I believe that the main facts contained in the above statement will be found true on further investigation.

---

## CHAPTER XVI.

Description of Sivas — Unwholesome air — Coal-hunting — Start back to Tocat — Tufaceous rock — View of the Star Mountain — Village of Sarù Yeri — Ascending the Star Mountain — Heaps of boulders — The Summit — Remains of a fort — Ancient road — View from the summit — Strabo's description of the mountain — Descent — Return to Tocat.

TO persons who come from the shores of the Black Sea, Sivas presents an appearance quite different from the towns on the north. The latter offer to the eye a mass of red-tiled roofs, and the houses are built in great measure of wood obtained from forests not far away. On crossing over to the southern slopes of the Chamlù Bel, vegetation greatly diminishes: trees become rare, and then disappear altogether, and even the bushes are few and assume a stunted appearance. The country has been many times burnt over by pastoral tribes, for the purpose of increasing the immediate supply of grass for their flocks; and the consequence is that the soil, no longer supported by the roots of trees and shrubs, has been carried off by the rain, and has left the rocks bare and destitute of the soil requisite to support vegetation. The scarcity of wood obliges the people to build their houses of stone or mud

bricks. Poplars are planted near every watercourse, but chiefly in enclosed gardens, in order to obtain rafters to support the heavy roofs of clay. From Sivas down to the Red Sea and the Persian Gulf, houses are constructed in this way; and where stone can be found sufficiently soft to be sawn, the buildings are all made of regularly-shaped blocks of stone, with vaulted ceilings, as at Cæsarea, Aleppo, Beyroot, &c. Sivas presents the appearance of a flat-roofed town, with here and there a modern-looking tiled house. It occupies level ground, but some fine old stone buildings rise above the general line of flat roofs, and on a hillock there is an old castle, in a tolerable state of preservation, one of whose towers has a clock that strikes the hours. Poplar and willow trees mingle a little verdure with the dull colour of the town; a few vegetable gardens extend along the outskirts, but no fruit is produced here: it is all brought from Tocat. It is said that more wine and raki are made in Sivas than in Tocat, though all the grapes have to be brought from abroad. In the latter place the fruit is made into various articles of food, to be kept and used through the winter; this cannot be done when the fruit has been injured by transportation. A few of the streets of Sivas have lately been paved: but the greater part are extremely muddy in winter, and indeed at all times. The common sewers lie open in the centre of many streets, rendering the atmosphere both disagreeable and unwholesome. Uninitiated travellers generally enter the town in-

voluntarily holding their hands to their noses. The climate of Sivas is severe, as might be expected from its elevation, which we found by barometer to be 4481 feet. Snow falls abundantly in winter, and lies long upon the ground; much of this is doubtless to be traced to the neighbourhood of the Chamlû Bel. This place has been a missionary station for about ten years, originally occupied by two families, and for several years past by three. One of the members of the mission is a physician, who has acquired a high reputation as a skilful surgeon through the whole region. The climate of the place appears to be unwholesome for foreigners: for, during these ten years, three families who have resided for a time have been obliged to leave the country on account of ill-health, and the three now here are so feeble that they will also soon be compelled to remove. Thus it will be seen that the post has used up six educated missionaries and their families in ten years, making an average missionary life of less than five years: a period hardly sufficient to enable most foreigners to acquire the language and fully to enter upon their work. There is evidently a great call for a native ministry in this land, suitably educated and fitted to take the place of the foreign teacher; but the fear entertained by many lest the natives should learn too much renders the prospect of a speedy supply of well-qualified men dark in the extreme. The mission to Turkey has now existed thirty-seven years; and if we are not to-day raising thoroughly-

trained labourers for this most promising field, it is to be feared that we never shall. On the other hand, the idea of carrying on such a work chiefly by means of, or under the exclusive direction of, foreigners, is one which is sustained neither by analogy nor by the experience of the Church. It is certainly clear that such was not the system of the Apostles. They ordained *natives* everywhere into the highest grades of labourers, whatever that was: they even left the work wholly in their hands. It may be that the moderns have improved upon the Apostles, and that we shall yet see what does not now appear. At least, this is the hope with which our souls have been fed. Nevertheless, I believe that Evangelical doctrines will not triumph in this land until they become indigenæ, and cease to be fed and controlled from abroad.

*Monday, July 4th.*—Some of our friends here have insisted that they could give us ocular proof of the existence of good coal in this neighbourhood, and we started in the morning for the “coal deposits,” said to lie in the hills to the south of Sivas. We reached the foot of these hills at 7. The first rock we met was a coarse conglomerate, formed of pebbles of a great variety of colours, united by a very strong red cement, immediately after which, and higher up the hill, we came upon the gypsum-beds. The gypsum here crumbles away wherever exposed to the air. Its dip in this place is about  $45^{\circ}$  to the north-east. We descended into a narrow gorge, where we were assured

coal existed at the bottom. The sides of this gorge were steep and rocky, making our descent, without any trace of a path, somewhat hazardous. Found the red sandstone underlying the gypsum, and with the same dip. A small stream runs through the narrow gorge or watercourse, and here we saw traces of lignite, or bituminous coal, we could not tell which, so fine as only slightly to colour the soil. We could not find a particle large enough to pick up. The larger specimens brought to me from this spot, as it was stated, are *now* claimed to have come from farther down, and I have not heard that it has been discovered in any other locality than this; it occurs in the red sandstone which underlies the gypsum-beds. The spot in which we saw the traces of lignite lies a little west of the Diarbekir road, about two hours, or six miles, S.S.E. of Sivas. Though ill repaid in our coal-hunting, we found and brought away magnificent specimens of crystalline gypsum, the finest I ever saw. The amount of this valuable mineral existing here is stupendous; it would alone supply the wants of the whole world to the end of time. The natives understand its use, and plaster with it the walls and ceilings of their houses, often skilfully working it into tasteful ornaments, and even covering their floors with a thick coating of the same substance.

*Tuesday, 5th.*—Started upon our return to Tocat, with the intention of ascending the Star Mountain on the way. Left town at 6:15, and reached the booth

opposite the guard-house at 11:30. Dr. West, of Sivas, and Mr. Burbank, a missionary residing at Bitlis, were to join us here, intending to leave Sivas a little after us, and they came up when we were lunching. While waiting for our friends we had an opportunity more particularly to examine the ledge of rock which rises perpendicularly near the river bank, of which I spoke on our way out. It is a fine specimen of tufa. It offers a smooth surface to a height of about 100 feet, thus exhibiting the internal structure to great advantage. There are layers of deposition which resemble strata, not made in exactly parallel lines, but rather by piecemeal. I suppose this to indicate that there were large masses of vegetable matter, which hindered regular deposition, the spaces of which were gradually pervaded by an infiltration of calcareous sand in solution. The structure of this rock seems to indicate that the tufa was deposited at distinct periods, the point of contact being marked by a margin of greater density and fineness, never smooth, but everywhere presenting the distortions common to tufa. It was easy to distinguish where a tree had fallen down; the calcareous deposit had collected around the trunk, the branches, and the leaves; this deposit hardened, and when the vegetable substance decomposed, it left its room quite empty, exhibiting its exact shape. The substance of the rock is highly crystalline, and perforated in every direction.

We left the main road just after crossing the little bridge by the mill, and turned up to the right into

a narrow lateral valley, directly toward the Star Mountain, of which we had, from this point, a very good general view. It here appeared a regular cone, sharp at the top, and covered from the middle up to near the summit with a stunted growth of bushes, furrowed by several broad lines of bare rock from the top downwards, formed by the descent of rain-water and

Star Mountain.

the rolling down of stones and detritus. The hills around were quite barren, with here and there a prominent rock, but generally covered with soil. The little plain in front was carpeted with grass of a rich green, and cut in two by the little stream which runs down to the bridge by the mill, with bushes and a solitary tree upon its banks. Our path seemed to be taking us straight to the very foot of the mountain;

but we found, as it always happens, that when we had passed the first hill there were others still separating us from its base. All these hills were equally barren of signs of vegetation, though mostly covered with soil; not even grass grew upon them. But we passed alluvial flats, which were under cultivation, and where moisture seemed to sustain a rank grass. We reached Sarù Yeri at 5:30, a Turkish village of forty houses, occupying the end of a narrow valley, and protected on the north by a hill of considerable height. The people, as usual, showed their inaccuracy in measuring time and distance by insisting that it is just as far from the mill to Karghùn as to Sarù Yeri; whereas we found it about twice as far to the latter place. It is also called four hours from the Bekjilik to Sarù Yeri; we made it in three, but we moved at a rapid pace. There must be about one hour's ride between Karghùn and Sarù Yeri. The people of this village received us very kindly, gave us the best lodgings the village afforded, and everything they had in the way of eatables. They are rarely visited by Franks, and are, therefore, more hospitable and unselfish than those who live upon the great routes of travel.

*Wednesday, 6th.*—The top of the mountain lies due east from us. We propose to make the ascent straight up from this point, no one in the village knowing anything about a road leading up to the top, of which we had heard elsewhere. One of these people, an old soldier, just returned home from Mossul, has offered to be

our guide; he says he has been to the top before, but his subsequent course proved either that this was false, or that he had failed to look about him. Not knowing whether he would prove to be a true guide or not, we made sure of his being useful by loading him with our instruments. We started at 5·30, the weather being beautifully clear and cool, with a slight breeze from the north. The observations already made with the barometer, and subsequently confirmed, enabled us to ascertain the elevation of Sarù Yeri to be 4957 feet, which is 120 feet above Karghùn, and not quite 500 feet above Sivas. Most of us were on horseback, intending to ride up as high as the ground permitted. Our course had to be zigzag, over somewhat unequal and undulating ground, with a rapid ascent. The soil was barren, on covered only with stunted grass, while we occasionally passed fine springs of water rushing by us. At 6·20 we reached a very fine, cold, and abundant spring, which issues out of the ground and rushes down the hill with great force. There is a place close by it where cattle are folded for the night during summer, while they feed by day upon the mountain-side. The enclosure is a rude stone wall. So far as I could ascertain by inquiries, corroborated by my own observations, this spring is the highest water to be found up the mountain. The spring on the other side may be higher up, but the statements of the village people are always inaccurate. They had told us, for instance, that this very spring was near the top of the mountain,

whereas we soon found we had still far to go before reaching the summit. Indeed, there were but one or two of the people of Sarù Yeri who claimed to have been to the top at all. The water of this spring flows towards the north-west into the northern branch of the Star River. The loose statement, therefore, which we had so often heard from the natives, even in the villages not very far off, that "a river flows from the top of the Star Mountain which is called the Star River," is founded not on fact, unless employed as a figurative mode of speech, which is certainly not incompatible with the habits of the people.

Leaving our horses at the spring, we began the ruder ascent on foot. We had hitherto found little or no rock in place, but now had for the most part to climb on the face of the rock, amid boulders and fragments fallen from above, with stunted bushes and flowers of great variety and unusual brilliancy growing among them. Higher up, grew dwarfish fir-trees, and our progress was impeded not only by the steepness of the ascent and by the slipperiness of the rock, but also by the thickly-matted bushes. After ascending the first steep acclivity we came to more level ground, and sitting down to breathe, we noticed that all the upper portion of the mountain was covered with masses of rounded boulders, varying in size from one to twenty feet in diameter, but more frequently of five to ten feet, of various shapes, but all having rounded sides and corners. These boulders were piled together to an

unknown depth in an irregular manner, and presented the appearance of streams of loose rocks. The whole mountain is formed of black granite, so that these rocks must be extremely hard, and the force employed in rounding off their edges must have been very great. Then the question arises, whence came these loose rocks. They cannot have been rolled down from the top, for we are near the top already, and, moreover, the very summit is piled with them. Nor can it be admitted that they have been brought from some other point, and heaped on this mountain; for I believe this rock does not occur again for several days' journey, indeed I am not aware of its being found either in fragments, or in place, nearer than the region above Yozghat. Moreover, had it been brought from elsewhere, it would not all have been piled upon this mountain: some of it would be found scattered below, or upon the neighbouring mountains, which is not the case. The action of freezing water is the only explanation we can give to the facts and phenomena before us. It cannot be supposed that these blocks were brought here by an iceberg and dropped in so compact a mass, for they would not all be of precisely the same rock as the mountain itself, but most probably of some different rock which the iceberg had taken up elsewhere. The whole surface of this granite cone was doubtless smooth when first thrown up from the bowels of the earth by the hand of the God of nature, and the extreme hardness of the rock long kept it so. But

cracks and fissures were in time made by the working of the elements; the winter rains and snows entered these fissures, froze, and by expansion, broke the surface into fragments, chiefly toward the summit of the mountain where the surface was not too steep. Those of the fragments which lay on the declivities rolled below; the others remained where they had been broken. These boulders are every winter frozen in together, and by the expanding force of ice rubbed and crushed upon one another, thereby breaking off their sharp angles and rounding them off in every direction. This would account for their present appearance, and account for it, too, without the supposition of any change of place. The largest of these boulders were nearest the top of the mountain, and the five hillocks which crown the summit are completely surrounded with them. I have thus far seen no evidence whatsoever of the action of glaciers or icebergs in Asia Minor. The top of Mount Olympus is of common granite, and offers precisely the same appearance as the summit of Star Mountain, the blocks or boulders all consisting of the same rock as that which constitutes the mountain itself. This process is going on at the present time on the tops of all our high mountains, but may be particularly seen at any season of the year on Mount Argœus, where the action of the ice has such force as to break off fragments of rock from the mountain and hurl them down its sides with detonations resembling artillery.

Our course being as nearly straight towards the top as the nature of the ground seemed to allow, we were obliged to pass over several of these heaps of boulders; indeed, they often appeared to cover the whole surface in sight. We were obliged to jump from one stone to another, and even to scramble over them on all-fours, careful to avoid the openings between, where we might slip, and become wedged in. I kept by Willie, in order to choose the easiest path and avoid danger, as well as to restrain that youthful ambition to push too fast toward the goal, which he would reach in a state of perspiration that would ill fit him to stand in the cool breeze at the top. The rest of the party moved on more rapidly, and, by diverging to the right, found the ground less encumbered with loose rocks, and, indeed, before reaching the top came upon the ancient road, still in a good state of preservation.

We reached the summit at 9. We saw only the finely crystallized black granite all the way up the mountain, and, as far as we could judge from appearances, there exists no other rock here. This is remarkable, because I believe it is the only spot where granite occurs in all this region. But the same thing is met with at Sivri Hissar, whose rock is so precisely similar to that of the Star Mountain that it is impossible to tell them apart. We found at the latter place specimens in which the black crystals were large and beautiful. Grass is growing up to the very summit; here we also picked flowers, and Willie

caught a butterfly. The crest of the mountain consists of five hillocks or natural mounds in a somewhat curved line, running nearly east and west, the

convex side being towards the north. The highest of these hillocks is the farthest west, and it is crowned with the remains of the fort, while its sides are covered both with natural boulders and with the hewn stone with which the fort was built. Judging

from the large quantity of stones, mostly granite, which showed signs of having been hewn by the hand of man, the fort must have been a lofty and solid structure; the latter quality must indeed have been an indispensable condition to its standing against the terrible blasts and storms of this high region. The foundations of the building have evidently been very thoroughly dug over, probably in search of treasure, so that but a small portion remains to point out the form of the fort. The part best preserved is a cyclopean wall forming the north-east face of the building, and running north-west and south-east; it measures 56 feet, and is flanked at each end by a solid square tower having a front of 12 feet, thus giving a face on this side of 80 feet. This is evidently the foundation of a wall, for it is level with the soil on the inside. It descends in front to a considerable depth, which cannot be ascertained on account of the mass of stone resting against it. Fourteen feet back from the outer face of this wall is another, built exactly parallel, extending only to the edge of the towers. Both these walls have but one straight face, the stones on the other being of unequal lengths and forms; and they are both level with the ground inside the fort. Back from the eastern extremity of the second wall stand the remains of a semicircular structure which must have been either a vault or a cistern. Outside the fort, and on the south-eastern edge of the hillock on which it was erected, is a cistern

in tolerably good preservation; it is built in the shape of a broad well, and is now about 20 feet deep. There are no other traces of foundation walls on the hillock which offers a rounded appearance, the wall now standing cutting off an arc. It is impossible to say whether there was a ditch around the fort, or

Ruins of Fort on the summit of Star Mountain.

whether it was strengthened by an outer wall, for the ground is heaped all around for a considerable distance with large blocks of stone, mostly hewn, but injured by the weather, though the hardness of the granite has doubtless enabled them to resist longer than other stones. The ancient road is distinctly visible, passing

in front of the fort, and going south; it then divides into two branches going east and west, evidently following the easiest slopes of the mountain. The western road was followed during a good portion of our descent. There is a considerable quantity of mortar lying about the ruin, as well as bricks. We also found a number of hewn blocks of tufa; it must have been brought from below, and was probably preferred for some particular purpose on account of its lightness, and can have been used only for the less solid portions of the structure.

We were fortunately joined at the summit by an old shepherd from the Star Village, who pointed out the various objects that are visible from this giddy height, and gave us otherwise valuable information. A carefully made observation with the barometer gave me the height of the top of the Star Mountain as 8556 feet above the sea. The day was fortunately beautiful, and the horizon clear. There was a slight breeze from the north-west, and the thermometer stood at 67° Fahrenheit in the shade. I was able to take valuable bearings of all the important objects visible from this point, which materially aided me in constructing the map of this region. We could distinctly see with the spyglass the Armenian Monastery, one hour from and opposite Tocat; the town itself is hidden in its deep valley, and we thus ascertained its precise position. In the direction of Sivas we could distinguish the road over Melekon, the town itself being hid by the plateau. Mount Argæus, near Cæsarea, appeared towering above

the horizon; we could just make out the Black Sea near Samsoon; the shepherd told us he could sometimes very clearly distinguish it. The distance is 50 hours, or 200 miles. The shepherd also pointed out the two branches of the Star River, which flow around opposite sides of the mountain and unite near the mill.

The view from this summit is truly striking as well as extensive. The mountain is wholly detached from the Chamlù Bel range, although it does not lie far to the south of it. It has already been seen that, geologically, it is quite distinct from that range, whose only volcanic rock, as far as yet ascertained, is trap rock or trachyte. There are several summits in that range which attain a considerable height; but none will compare with the Star Mountain, which, in its turn, is but one-half the height of Mount Argæus. From this elevation the whole region around us, though mountainous, seems almost level, yet no plains of any size are in sight. Even the great Kaz Ova lies hid among the mountains, and its place seems a deep gully running east and west.

I have, thus far, given myself wholly to the description of this interesting locality and have kept old Strabo in the background. I shall now simply report his language, and leave the reader to judge whether we are on the spot he describes. He says (*Lib. xii. cap. iii. p. 39*), speaking of the province of Cabira, which Hamilton has shown (see 'Researches,'

vol. i. p. 347) to be the modern Niksar, that "here also is the so-called New Post."\* He describes it as "a barren and isolated rock, distant from Capira less than 200 stadia (24 miles). There is a spring at the summit whence pours forth much water, and a river flows in a deep ravine around the base. The rock above is of stupendous height, making the fort impregnable. It is a wonderful fortress, yet the Romans destroyed it; the surrounding region is so wooded, mountainous, and destitute of water, for a space of 120 stadia (14 miles), that military operations are out of the question. Here Mithridates kept his most valuable treasures, which are now laid up in the Capitol, where they were consecrated by Pompey."

There is no need of any comment, but simply to mention that the Star Mountain is hardly 28 miles from Niksar by the present Turkish roads, which are no roads at all, but mere tracks made by passing over the ground; it is not hard to suppose that under Mithridates, or rather his Roman successors, the distance would be four miles shorter. The Star Mountain has, indeed, no forests immediately around it; but they are not far off, and as the hills have plenty of soil and have been under cultivation, the probability is that the whole surrounding region was once an unbroken forest, like the Chamliù Bel; while the great steepness of the Star Mountain itself, causing the soil as soon as formed to

\* In the language of modern Asia Minor this would be Yeni-keuy, the new village; a hundred places are so called now.

be washed away, makes it difficult to suppose that many trees ever grew upon it. On the whole, Strabo's picture is not only correct, but vivid and characteristic. Indeed, one can easily understand that the wily Mithridates would keep his most valuable treasures in such a place as this. The access to the very base of the mountain is defended by narrow gorges, some of which were strongly fortified in ancient times. The passes through the Chamlù Bel at the Bekjilik, and from the Art Ova, as well as the Sivas Bekjilik, and through the Kara Dere, could each be defended against large forces by a handful of men. The whole region around is arid, and furnishes no supplies for an army. The mountain itself is difficult of ascent. A besieging force must lie exposed to the inclemencies of the weather; and the position of the fort is such that it could only be taken by starving out the garrison.

We were but an hour descending from the top to the spring where we had left our horses. We found quite a group of villagers there, attracted to the spot by the sight of our smoke and the flavour of a sheep which was being roasted whole, turning before a blazing fire upon a wooden spit. It was a grand meal, seasoned by wholesome exercise, mountain air, splendid water, and merry companionship, and full justice was done to it by all the guests. The thoroughly picked skeleton was set upon a pole, and several fine eagles were pecking at it before we were out of sight. We reached the village at four, and the friends who

had joined us from Sivas started immediately upon their return home.

*Thursday, 7th.*—Left Sarù Yeri at 5·30 A.M., forded the northern branch of the Star River. Both the branches I have observed to be low and easily forded during the summer months. But during a great portion of the year fording is dangerous, and travellers have been drowned in attempting it. They have to be crossed at the bridges which stand upon all the principal roads. The Star River was here 10 feet wide, and ran from right to left through a small plain, at the other side of which lies the village of Boodookhtoon, which we reached at 6·25. The top of the Star Mountain bore from this place a little south of east. We travelled among forests of pine, and reached the highest point at 9·30. Rock—green shales, often assuming dark shades, almost like jasper. We descended from the summer *yailas* of the Koordish tribes and the pine forests, through which we had been travelling, to a more varied and luxuriant vegetation; passed the summer dwellings of the people of Semerji Keuy on our right, which overlooked a deep and beautiful valley, and came upon the Sivas summer or post road a little above the Robbers' Hill. We reached our house at Tocat at 5·15.

## CHAPTER XVII.

Circassian music — Bishop Keshish Oghloo — Dedication of new chapel — Start for overland journey — Praying places — Villages of Seungut Keuy and Pazar Keuy — Fountain of Chermook — Farm of Haji Boghos Agha — Kîzûlbash labourers — Swamps of the Kaz Ova — A pair of somersaults — Village of Yeghin Musulman — Spirits of Turkish saints — Village of Chiflik — Village of Euren.

**T**OCAT, *Saturday, July 16th.* — Some poor Circassians in rags have been performing music and dancing in the street before our door to-day, in hope of obtaining a present. One of them played upon an iron flute of the kind called *naï*, while another kept time with an instrument I have never seen before. It is made of square pieces of board of equal size, fastened together like the leaves of a book, and is held by a handle, and jerked up and down, the boards clapping at every motion. A little boy danced to the music very much as do the Bulgarian peasants, taking off his cap and throwing it up. The *naï* was small and the tune monotonous.

Last Sunday the newly appointed Armenian Bishop of Tocat made his triumphal entry into town, accom-

panied by some 200 horsemen, comprising all the principal Armenian gentlemen of the place. They were all in great gala, and his holiness rode a fine horse, handsomely caparisoned. On Monday he went to the Conak, where his firman was read before the council and chief citizens. This Bishop is none other than the well known and notorious Keshish Oghloo, Vartabed of the Armenian convent at Bizeri, whom the people despise for his infidelity, priestcraft, and ignorance; but he is cunning, and has shown much skill in managing Turkish officials; the most influential Armenians here, therefore, have declared him to be the man of their choice—for the place has been sometime vacant. They accordingly sent a petition to the Patriarch, who obtained the necessary firman from the Porte, and the wily priest is now fully installed Bishop.

The work upon our chapel and school has so far advanced as to be very nearly completed. What little remains to be done can safely be entrusted to the pastor and deacon, who have already so cheerfully and usefully accomplished the most important task. It was moreover time that we should be setting our faces westward on our long overland journey. The pastor elect was therefore duly and publicly examined as to his faith and qualification for the pastoral office into which he had not yet been fully installed. With the approval of all present, as well as of the representatives of the Sivas Mission, and of the Evangelical Church there,

the ordination services took place on Sunday, July 24, as well as the dedication services of the newly erected chapel. The audience was large and interested, and the sacramental services of the afternoon were perhaps still more impressive. It was, indeed, hard to part with this little flock, left comparatively alone in the wilderness. But their situation was far better than in 1861, when we had left them before. They were now perfectly harmonious: had their own pastor regularly ordained over them, and a valuable and popular teacher in charge of the school. The chapel and school were all that could be desired, and gave to the Protestants there a feeling of security against the apprehension of some day being left at the mercy of their enemies, with no option but to get reconciled as best they could with the Armenian Church ecclesiastics. They had the elements of growth within themselves; would ere long be able to support their Christian institutions, their pastor, and school-master, and would cease to require further aid from abroad. I should probably have felt differently could I have foreseen that the teacher, broken down by inadequate support, his salary being cut down to a mere pittance, and reduced below that of a common day-labourer, would sicken of typhus and cerebral fever, and when feeble in mind and body would be persuaded by his friends to make his peace with the old Church, and accept a competent support from them for teaching their children as he had taught those of the Protes-

stants. There were other sources of anxiety, too, from which we then were free. But enough.

*Wednesday, July 27th.*—The house was early filled with friends who had come to see us off; men, women, and children had a last word to say, and “salams” and “parevs” to send to the absent ones whom we hoped soon to meet. A number of friends accompanied us out of town, riding on horses and donkeys. We started at 9:30, having been delayed even in the streets by many who stood upon their doorsteps to bid us good-bye. We took the usual road through the *meïdan*, between the great stone khan and the marble mosque, by the ruins of the ancient palace of the Abasidian khans, and under the tottering battlements of the old castle, and proceeded through the gardens and vineyards along the left bank of the Iris. We stopped to lunch at the ancient Muslem praying place, a handsome marble structure two hours from town. It is hard to say what the purpose of these praying places, so called, could have been. The one which lies just outside Tocat, on our present road, has a sort of indication of a Kûbleh. It seems much more probable, from their position at important places by the road side, that they were intended as stations for a police force, or for custom-house officers. The one upon the hill opposite the town, however, must have been a mosque. Our friends had parted from us just before we reached this spot. We were again on our way at 1:15, and passed the Turkish village of Seungut Keuy, “the village of

the golden duck," situated on the slope of a hill almost entirely surrounded by swamps. A great variety of ducks frequent this place in the winter season, and cranes are said to live here altogether, and to breed their young in the tall grass. But I have never seen more than three or four of these birds here at once. They are said to be extremely hard to approach, and when pursued will run with great speed. They are doubtless of the same species as those which perform their distant migrations twice every year; but the natives distinguish these as "yerli," indigenous. The river is spanned by an old and steep bridge of four arches, a Muslem structure, whose perforated sides are peopled with wild pigeons. At 3.20 we came to Pazar Keuy, a large Turkish village built on the edge of the plain, and surrounded by extensive gardens and vineyards, water being very abundant. A weekly market is held here for the accommodation of the villages of this part of the plain. It is the residence of a Mudir and Cadi, whose authority extends over the whole *sanjak* or district of the Kaz Ova. The village contains several shops and stores; it has lately received the accession of a number of Circassian families, who are said to be very troublesome, helping themselves to their neighbours' property wherever they find it, instead of working for their own support. Instead of passing through the village, we took a more direct road through the gardens on the right, and then, leaving the common highway which passed along the plain,

and is now very hot and dusty, rode upon the bluffs which skirt it on the left. These bluffs are well cultivated and shaded with trees. We turned into a side valley, or gorge, beautiful with gardens and orchards, with a fine stream coming down from the mountain, and passing through the Turkish village of Farno, continued along the slope, until at 5.30 we passed the Fountain of Chermook. This is a spring whose waters rush out with force from beneath a ledge of limestone rock some 30 to 50 feet high. It is well shaded by poplars and willows. Over the spring stands an old bath, whose well-worn stones indicate that it has been in use for centuries past. The water is supposed to possess medicinal properties, and is resorted to even from distant places. The name indicates this, for Chermook means a mineral spring. We could not, however, perceive that it differed from ordinary water, either in taste or in temperature. There was once a village here, for there are ruins of houses and a decayed mosque. A garden is still cultivated: the place, however, seems to be feverish owing to the want of draining, which might be remedied at a trifling expense.

At 6.30 we reached the *chiflik*, or farm, of our Armenian friend, Haji Boghos Agha, from whom we had received a cordial invitation to spend a night with him. It is a valuable property, of which the arable lands extend across the whole plain to the mountains on the north, and even occupy both banks of the Iris, as it

turns northward towards Toorkhal. This gentleman is possessed of great natural intelligence, and has enjoyed the best educational advantages procurable in the country. He has travelled in all parts of Turkey, though hardly 25 years of age. Agriculture he loves with passion, and practised it with success; but, as generally happens to the Christian subjects of the Porte, the Turks of the whole region, envious of his prosperity, have combined to ruin him. They obtained an order from the Sublime Porte, requiring that all lands which had not been sown for three years should be given up to the Circassians. In this country where the system of rotation in crops is unknown, where land is abundant and labour scarce, a great portion of the arable land necessarily lies fallow for long periods. The authorities of Tocat and Pazar Keuy selected the most valuable fields on our friend's estate, proved by Muslim false witnesses that they had not been cultivated for three years, and sent a band of stout and well-armed Circassians to take possession of them. They settled down only a mile from the very house occupied by Haji Boghos Agha himself. And now there is no end to the robberies and vexations inflicted by these men. The rightful owner has already spent much of his property in the vain attempt to obtain redress; and he assured us he was only waiting for an opportunity to sell his estate without too great a sacrifice, leave the place altogether, and purchase a farm in the neighbourhood of Constantinople or Smyrna, where

he believed the Turks would not dare to treat him thus under the very eyes of the representatives of the European powers. There can be no doubt that such conduct on the part of the ruling race, even where it benefits them immediately, must ultimately end in their ruin; and it argues great blindness on the part of the Government authorities not to perceive it. Everybody can see that this large farm, under the skilful management of its present proprietor, brings a considerable revenue to the Government in the shape of taxes, while the wretched Circassians, who are put forward to gratify Turkish bigotry and envy, will, in spite of the fine lands now handed over to them, long continue to prove a burden to the Government Treasury. Thus does bigotry ever defeat and punish itself; and wasted and starved Turkey is already starving those who claim alone the right to be fed by her.

The people who work on our friend's farm are mostly Kùzùlbashes, whom he finds very laborious, less deceitful than the Christians, and more obedient than the Turks. They build their own houses, which are circular, with floors considerably lower than the level of the ground, and flat roofs. These people look strong and hardy, and belong to a peculiar race, probably one of the earliest that occupied the Peninsula of Asia Minor. They profess to be Mohammedans, but this profession is known not to be sincere, and the Turks themselves are fully aware of it, and thoroughly hate them for it. They do not believe in God, and hold to the trans-

migration of souls. In imitation of the Muslems, they give their religious teachers the names of Hoja (sheikh), and Dervish (religious devotee). We saw here an old man said to be 90 years of age, but strong and erect, who is called Dervish Hussein Baba. He seemed quite gratified by the proposal to draw his picture. I noticed that he had remarkably small hands and feet. Though many of these people are found in all the large towns of Turkey engaged in every trade, and filling every office in the gift of Government, yet they are mostly addicted to agricultural pursuits: their women do not veil themselves in the presence of Christians, but only of Turks.

*Thursday, 28th.*—The swamps of the Kaz Ova are in full sight below us. They do not affect the healthfulness of this place, because the wind does not blow from that direction during the fever season. In winter they are the great resort of ducks and wild geese, which give their name to the plain; they are sometimes shot by means of flat boats launched upon the swamp, in which the sportsman hides himself under green boughs, and advances stealthily among the reeds. There are three places where the water is very deep. Our host thinks they cannot be drained by a cut to the river, which he believes too high opposite the swamp. It is generally supposed that the intermittent fevers which prevail among the country houses situated farthest west in the neighbourhood of Tocat, owe their origin to the miasma borne from this swamp by the westerly winds.

I cannot believe it to be so. The distance, seven hours at least, is too great. The swamps around Seungut Keny are doubtless the origin of that malaria, and the two chifliks, which are near to the latter swamp, suffer most severely, while the Tash Chiflik is perfectly free from fever. The swamps of the Kaz Ova are the resort of numerous wild boars, which come out at night and waste the neighbouring fields of grain. They have to be watched for a shot; but as the people are Muslems, they are often left to rot in the field and breed disease, so that Government officers have to come and force the farmers of the neighbourhood to bury them.

Started at 7.15. Went over the hills to the west. At 9.30 saw the town and castle of Zileh; it is built upon a broad hill with level surface, the town lying at the foot of it on the south-east and north-east sides. We now had a good view of the plain of Zileh, which we were skirting; it looked yellow from the stubble remaining in the fields after the harvest, and the appearance, therefore, was one of aridity, though we know that it is very productive. But the villages, which are numerous, were surrounded with verdure. While travelling over a good smooth road, our pack-horse, which was going at a good round pace, hit his fore-foot against a stone, and had such a fall as I never yet saw a horse accomplish. He went down head foremost, turned a complete somersault, and came to the ground with his four feet up in the air, his neck twisted round, and the

whole load resting on his head. The thing was done so quickly that the first we knew of it was the sight of the poor animal lying on the ground in that dangerous position, running the risk of breaking his neck if aid was delayed; indeed, we did for a moment think his neck *was* broken. The muleteer was just behind him, riding a diminutive donkey, and in his haste to dismount became entangled by the ropes, and went right over as if in imitation of the brute's performance, feet up and head down. In spite of our alarm, we all burst into peals of laughter; a knife soon cut the cords of the load and set the poor animal free, and he was carrying his burden again in a few minutes as though nothing had happened. We now entered a narrow valley, which we followed along its eastern side. It is fertile, and its little river flows north toward Zileh, supplying several flour-mills along its course. Went over undulating ground into a plain, and crossing a small stream entered the Turkish village of Yeghin Musulman (Bigoted Muslems) at 12-30. We saw orchards and gardens around the village, and found, upon inquiry, that we might, for hire, occupy one of them. It was surrounded by a mud wall, and thickly planted with fruit-trees, which afforded a pleasant shade; the only means of access was by a small door at the end of a bridge, formed of a single plank over the stream, thus affording us a good shelter from the intrusion of the curious. There was, moreover, an immense stable for our horses near by. In this delightful spot we pitched our

tent, and were soon quite at home. The tent stood near the graves of three Turkish saints, over which grew a vine; the Imam of the village, who had special charge of the sacred spot, soon paid us a visit, and after many preliminaries and much general talk, advised us, for our own comfort, not to remain here. It was Thursday, he said, and the saint was in the habit of coming out of his grave, on the night of Thursday to Friday, to wash his hands and feet and say his *namaz*; he was apt to be troublesome to strangers upon such occasions (he meant Giaours), and we had better keep out of his way. I assured him that we were well acquainted with that kind of people, and never allowed them to disturb us; that the buzzing of a fly would awake us, that our dogs never slept, and that our fire-arms comprised twenty-five to thirty barrels loaded and primed; in case one or two shots should miss the mark, which was not their habit, one of the rest would teach any disturber of our peace that we were not people to be trifled with. "Oh! said the Imam, your gun will not go off if aimed at *him*!" "Good!" I replied, "we shall run no risk of treating him with disrespect, or of hurting his Saintship. In case our guns do not go off we shall know it is *he*, and we shall let him move on; but if the gun fires it will certainly be a robber, and we shall fire again and again until we kill him or he cries *Aman*! Our guns are English; they never miss fire; you see they are very different from anything you have ever seen." At this speech he made a very wry face. It probably saved us

---

a nightly visit. Had we not felt too tired, and in need of sleep, we might have expressed some fears so as to secure a call from the tricky priest, and have given him a fright he would have remembered the rest of his life. He asked me the next morning, with a smile, whether we had seen anything during the night? I very gravely replied that we thought we had heard a slight noise on the other side of the wall, and our dogs had barked; but, seeing nothing, we had not fired. He winked his eye and whispered it was *he*.

The elevation of this place by the barometer is 2760 feet. This result cannot be far out of the way; but the weather was fitful and blustering, and such as to cause the mercury to fall below its mean level. About 5 P.M. the wind blew for a while so strong from the north that it seemed as though it would tear down the trees of our orchard; the tallest of our poplars in particular bent fearfully. The young men obtained a considerable quantity of small game on the trees about us, which seemed to be their favourite resort, especially about roosting-time, and the Imam had an opportunity of convincing himself that what I had said of our guns was not a vain boast.

It may here be remarked that the weather has particularly favoured me in my observations with the barometer. During all our journeyings the sky was clear, except upon the occasions specified in my journal. This is important, for the most unvarying and uniform weather is indispensable to give perfect accuracy to

the barometrical observations by which heights have to be calculated. The fact sufficiently explains the discrepancies to be found in the calculation of heights given by different travellers. But, with this reservation, it cannot be denied that measurements with the barometer are quite as reliable as trigonometrical surveys.

*Friday, 29th.*—We left this morning at 6.15. At 10.15 we entered the miserable little village of Chiflik, and, crossing a little stream, entered and took possession of a small orchard, thickly planted with fruit-trees and poplars. We rested here for several hours, greatly enjoying the cool shade and the refreshing breeze; the only disturbance we met with was from an old woman who stood outside of the hedge, and for a long time vented her fanaticism by cursing us in all the terms of her rich vocabulary, for polluting her orchard with our *giaourship*. As there was no fruit we could do no possible harm, so we just let her enjoy the sound of her own voice until she stopped from exhaustion. The land all around is fertile, and seems to yield good crops; but, at this season, it looks parched and dry. The grain had been gathered in, and even the *harmans* had disappeared. The only verdure to be seen is in the immediate vicinity of the villages, which are uniformly built near some spring or water-course, and are shaded with trees, mostly poplars, walnuts, and willows. We had heard last night, at Yeghin Musulman, that some Franks had been there, and had obtained several of

those peculiar excrescences found upon the trunks of walnut-trees, which are used in veneering, and are called "loupes" by the French. From all accounts, these seem to be common, and of a valuable quality, in Asia Minor, for we have heard of their being sought for and taken away from all parts of the Peninsula by men who have come from Europe expressly for that purpose; it is said that some of these people have made their fortunes in this way. We left our resting-place at 1.45, and travelled in a W.S.W. direction. The plain gradually rose, and became contracted between the bushy heights on the right and left. We reached the highest ground on this part of our road at 2.45, and ascended to an elevation whence we overlooked the valley of the Chekerek Soo, a tributary of the Iris, which falls into it on the north of Zileh. The descent into this valley was very steep. At 3 we passed through a village built upon the slope, in which the chimney-tops were made of osier baskets. Riding over undulating and cultivated ground, which rose as it receded from the river bank, we passed several large villages, where we had intended to stop, but found that all the people were gone to their summer quarters or *yailas*. We went on, therefore, to the village of Euren, and selected a beautiful camping-ground on a high terrace overlooking a series of vineyards occupying the sloping hill in front of the village, shaded and partly protected on the north by a row of cherry-trees. There is a fine old fountain at the corner, with two tall

---

walnut-trees by its side. This spot was frequented by turtle-doves, which were numerous, flying all about us. While the tent was being pitched our sportsmen bagged a sufficient number of the poor birds for a plentiful supper; a spit was improvised, and the cookery was worthy of the occasion. This spot is high and airy, and a tented traveller could nowhere spend a more agreeable or refreshing night. I recommend to our successors the terraced garden of Euren, under the cherry-trees, with a supper of turtle-doves roasted on a ramrod.

## CHAPTER XVIII.

Turkish village of Beyordoo — Flattering reception — First sight of camels — Hot spring and bath — Village of Keuhneh — Travelling Koords — Town of Yozghat — Change of muleteers — Valley of Kamishjy Boghaz — Pass of Devrend Boghaz — Ruins of the temple and city of Pterium.

SATURDAY, *July 30th.*—Started at 6.15. Ascending a gorge which grew narrow and picturesque as we proceeded, we came to cliffs of green shale and limestone, indicating a great perturbation. Started a fine covey of red-legged partridges on the bank of the stream. At 9.45 passed over the hill at the end of the gorge among the bold trachytic rocks, which have evidently caused all this disturbance and breaking up of the crust. At 10 came to a small village on the north side of a little valley, which runs off to our right. We were constantly mounting as we rode on. Having reached the highest point of our ascent, we at once began to go down into another valley, and travelled along the side of a narrow gorge, whose little stream runs down in a direction opposite to our own course. The hills on both sides are low; they bear only scrub oak bushes, and small wild cypress, completely shutting us in, so that the heat is intense,

and very trying. We were glad to see ahead of us the Turkish village of Beyordoo, which we reached at 11:30, crossing the small stream upon a wooden bridge at its entrance. It possesses a stone mosque, and the whole population were in holiday attire engaged in the festivities of a marriage which is to take place to-morrow. As soon as we appeared in sight of the village a procession was formed to meet us. We were preceded by the *davool* (drum), and *zoorna* (hautbois); made a grand entrance into the village; and were led up to the mosque, around which the people were collected. They proposed that we should alight there, promising us all sorts of comforts; but, having spied a beautiful grove of tall willows planted in a circle behind the village, we passed through the *harmans* (threshing-floors), whose heaped grain at once indicated that we had reached a more elevated region, and alighted in the fine grove, which effectually preserved us from the sun's rays, while it allowed the breeze to reach us unimpeded. There is a fountain of good water close by, and the young men found a fair supply of turtle-doves to shoot—the hope of our larder in this region. As we went to our quarters, however, the music and the crowd followed close at our heels; and the only way we could get rid of the nuisance was to pay the customary *bakshish*.

We were again in the saddle at 2:15. Reached the highest point on the hills at 3:10, and here met the first camels we have yet seen on our jour-

ney. They are not unfrequently found in the Kaz Ova, and the Art Ova, though in small numbers. They are chiefly employed in carrying ore from the mines about Kharpoot to the foundry at Tocat, and thence the copper bars to Samsoon. But they are not numerous in that region; they appear to avoid the northern portions of the Peninsula, where the dense forests, and the generally clayey soil, cause the mud to remain longer on the ground, making travel dangerous to these animals. They are owned exclusively by the Koordish tribes in Eastern Asia Minor, the northernmost of whom roam over the country which lies between Amasia, Chorum, Zileh, and Tocat. The Avshar Koords occupy the country around Cæsarea, chiefly to the east and north of that place. They, however, make excursions as far as the neighbourhood of Karghùn and Gurun. They all have camels, some of which are very fine. Farther west the Koords give way to the Turkmen.

We now began to descend toward a very extensive undulating plain, in which lie Keuhneh, Sorkun, and other important towns. No high mountain appeared in any quarter of the horizon. We passed over a series of low hills, with neither tree nor shrub, most of which have at some period been under cultivation. There was fallow land enough for the Sultan to supply any number of his Circassian guests, without robbing his Christian subjects. Shallow valleys occupy the lower grounds, and convey the waters of the region southward to the

Halys. At 3.45 we descended into a fertile valley a quarter of a mile wide, which runs toward the south-west. All the rock around here continues to be green shales. The height from which we had descended appears to form the watershed between the Halys and the Iris. Before we reached it all the streams flowed toward the Chekerek, which is a tributary of the Iris. We now found them all flowing toward a stream that passes by Keuhneh, and goes southward toward the Halys. Kiepert's map makes all these streams tributary to the Chekerek, which is a mistake; but the region appears not to have been examined before, as Kiepert marks the course of the streams only with dots. At 4.30 passed a village on our left, and by it an extensive and apparently ancient cemetery, with large blocks of rough stone to mark the graves. The plain now widens, the hills which enclose it continuing very low and rolling; it is well planted with wheat, flax, beans, and Indian corn, or maize. The water of the little stream is used for the purpose of irrigation. At 6.30 we passed through the village of Karûlar (women). From this we descended at 7 to a still lower level, a purely alluvial plain, which appears very rich. It will thus be seen that there are here several distinct levels, the highest being shown by the low hills of green shales, and the lowest being alluvium. We now came upon the stream, which we found about 10 feet wide: it is used to water gardens on both banks. We found upon the left side an encampment of Koords, whose flocks of goats and

sheep were feeding in the grassy meadow, guarded by savage-looking dogs. There were several Angora goats among them, distinguished from the rest by their pure white colour, and the glossiness of their coat. Their form, however, seemed more like sheep than goats. These were the first specimens of this breed we had met on this journey. I was disappointed to find them so small; I inferred they were young, but subsequent observation upon a large scale has convinced me that this kind of goat stands a good deal lower on his legs, and is smaller every way than the common species.

As we crossed the stream, a solitary camel of large size was led along the road, majestically bearing a very large *maffa* filled with women. It was handsomely rigged out, and appeared to belong to people of wealth. They were probably coming to the hot baths. These are situated near the right bank of the river, the hot water issuing from a spot about 20 feet above the level of the stream, and flowing into it. Over this spring is erected a building, which consists simply of a square enclosure of stone walls, 30 feet by 20, and 12 feet high, of modern construction, with a door near the south-west corner, and recesses in the walls for stowing away the clothes. Timbers are laid across the top, so that it can be covered with a tent-cloth in the winter. The bath itself consists of a depression, or oblong basin, at the north-east corner, paved with slabs and 10 feet lower than the general floor. The spring issues at the corner itself, and a

hole in the eastern wall constantly carries away the surplus water, maintaining a depth of about 4 feet. The basin measures 12 feet by 10, and there are stone steps leading down into the water. I wished to obtain

Hot Spring, near Keulnek.

the temperature of the water, but my thermometer marked only  $140^{\circ}$  of Fahrenheit, which the mercury so quickly reached that I was unable to make an observation. The water is whitish, as though containing some alkali, but it forms no deposit. In the basin it felt quite warm; and it was almost impossible to hold the hand in it where it issued from the ground. The place is resorted to by many people from the whole

surrounding region, it being supposed to contain valuable medicinal properties; but it is said to be hurtful to remain long in it. The water which runs out of the hole at the eastern wall falls into deep trenches, which are lined with hewn stones. The lowest of these are large, and appear very old, arguing that the ancients made use of this spring. On the inner face of the northern wall is a Turkish inscription cut in the stone, probably placed there when the building was repaired. No fees are required, and no one appears to have charge of the place, although a small house, close by, is occupied by people who seem to sell refreshments or keep lodgers. The effect of the water upon the skin was found to be somewhat peculiar by those of us who went into it. As long as a limb or the whole body was immersed no particular sensation was experienced, but, when brought out into the air, the skin at once became extremely hot, and remained so for some time; it was covered also with irregular red patches. The general effect upon the system, after remaining even but a few minutes in the water, was drowsiness, hunger, and great weakness. A slight whitish deposit is left upon the skin, which, on rubbing, feels like soap. The water of this spring rapidly dissolves soap.

The hills from which we had descended were of green shales; but, when we reached the plain itself, we found that even its highest level was formed of sandstone, which, in some places, is quite red. But, at the spring, the rock is coarse granite. We found

granite also all the way from the spring to the large village of Keuhneh lying directly north of it, about one hour distant. The hillocks which bound the plain on the west are all of the same rock, and boulders are lying about, and are used as landmarks for the fields. The soil around Keuhneh is level, fertile, and well cultivated. We passed through the village, and found a convenient garden on its southern edge, where we pitched our tent under a cluster of trees.

*Sunday, 31st.*—We had a pleasant and quiet day of rest; we spent most of it in reading and singing, and had a refreshing little service by ourselves. In the afternoon we had some interesting calls, among which was that of a young Circassian officer in the Turkish service, who has come here to take the baths. The country around us is one extensive level plain, under good cultivation, with here and there clusters of trees, and bounded near the horizon by low hills, such as we had passed on our way here. There are many mares kept in these fields, and some of them appear to be fine animals. We also saw a good many camels, one of them white. The horned cattle, however, are small, and look feeble. Keuhneh is at an elevation of 3752 feet, which shows a considerable rise since we left Tocat. We are, indeed, but 700 feet lower than Sivas, while the climate appears to be much milder. But there is no Chamlù Bel about here!

*Monday, August 1st.*—We had a ride of six hours before us to Yozghat, and a rise of about 700 feet,

not to speak of the greater heights we might have to encounter on the way. We started at 5.30 A.M., and following a direction due west, soon overtook a Koordish tribe, who were travelling, with all their goods and chattels, in the same direction as ourselves. There were long lines of camels loaded with property; the men and women mostly rode horses and donkeys. Several carried hawks upon their fists, and wore a thick glove for this purpose; all the birds were blind-folded. They had several dogs, but only one seemed to be fit for sporting purposes. The chief rode upon a skeleton of a horse at the head of the file; he was an old man, and proposed to give us the hawk he was carrying upon his fist, in exchange for one of our dogs. We replied that *our* hawks, pointing to our guns, were quicker, more obedient, and less troublesome than his, so that we did not care to acquire any of his birds. The country all around here is wearisome to the sight. Neither tree nor bush relieves the eye; the land has all the appearance of having been formerly under cultivation, but there is a scarcity of water in it. Came upon the highroad from Amasia and Chorum; it has lately been repaired in this part, and is good for carriages. It looked like civilization to see the lines of the telegraph upon it. Went over the hill, and from the top obtained the first sight of the town of Yozghat, which lies at the bottom of a valley running east and west, rising slightly upon the slopes on either side. Vegetable patches occupy the bottom of

the valley; there are some trees and private gardens about the town, and an isolated grove upon the slope of the southern hill. With these exceptions all is barren and parched. The houses are made of rough stones united with mud, or of mud bricks, and are all covered with red tiles. As we approached the town, we could distinguish some very good-looking houses, and one handsome mosque with a minaret. The size of Yozghat is about half that of Tocat. The rock at the bottom of the valley is sandstone, which, in some places, is of a deep red, like brick, and in others of as deep yellow an ochre. We reached the town at 11:30, and went to the house of the Rev. Mr. Farnsworth, an American missionary who is stationed in Cæsarea, and often spends the summer in this place. His house is situated upon a slight declivity, which overlooks the gardens at the bottom of the valley, and affords a good view of a considerable portion of the city. We could distinguish from this spot a wall about 10 feet high running around the town, though it is broken down in several places. Yozghat is a place of recent origin; its convenient position with regard to this portion of the country, has led to its being made the seat of government for the Province.

*Tuesday, 2nd.*—The native Evangelical Church and community have been very frank and cordial in their intercourse with us, and I am pleased with their spirit, and their earnest desire for instruction and improvement. I visited their prosperous school, and

at their own request, addressed them in the chapel, respecting the condition of their brethren in different parts of the country. I found the elevation of Yozghat, at Mr. F.'s house, to be 4418 feet. This is equal to the height of Sivas. The climate of these two towns is said to be identical, but the position of Yozghat, in a narrow valley, must expose it to be visited by strong winds, while there may perhaps be less snow than at Sivas.

*Wednesday, 3rd.*—We left Yozghat at 9.30 A.M. We had been obliged to part with our faithful Tocat muleteers, they having engaged to come only as far as here. Their places were taken by two Turks, who came to us very highly recommended, but whom we immediately discovered to be quite ignorant of their business; longer experience unfortunately revealed so many other failings, that we seized the first opportunity of getting rid of them. Our road led us in a northerly direction, through a narrow gorge, which took us to the summit of the high hills, on that side of the valley of Yozghat. The steepness of the road, and the inexperience of our new hands occasioned much delay; for the load turned over several times, and once barely escaped falling down a precipice of great depth; as it was, one box rolled some distance down the hill. We had to set our own shoulders to the work of loading, and greatly regretted the loss of Osman Agha, our neighbour at Tocat and a member of the police force of that place, whom we had taken as guide as far as

Yozghat, and who had turned out the most accommodating and useful fellow I ever had with me upon the road; he was invaluable in always getting us the best accommodation and provisions our resting-place possessed, acted as groom and horse-doctor on emergencies, and was everywhere and everything; best of all, he left us with evident regret, and was pleased with very moderate pay. I believe that he and our muleteers would have come with us as far as our journey's end, had not both they and we been afraid of the cost of their return home; it is certain, however, that we should have found it economical had we engaged them at any reasonable price. We henceforth depended upon the good will of the pashas and mudirs, and a handsome bakshish, for a guide; the man the Governor of Yozghat gave us knew so little of the road, that he had to inquire about it as we proceeded, and was constantly talking about his being very feeble, and having just recovered from a long illness, and his horse having just come from eating grass; he always extended his hand for and expected the best morsels at each of our meals, and could not refrain from helping us to get rid of our tea; he finally abandoned us long before reaching the point to which he had promised to accompany us, saying he would utterly break down if he proceeded any further; this was probably a trick for getting a present, but it failed, for we took him at his word and summarily dismissed him. Our progress was very slow, owing to the steepness

---

of the ground, and still more to the frequent turning over of our loads, from the ignorance and inexperience of our new muleteers. Indeed they had to take several regular lessons on loading before we could make any head-way; and in order to do this, we ourselves loaded our two pack-horses systematically before their eyes, as we had learnt by long experience and travel; adding sundry homely expositions of the philosophy and the laws of balance, and the strain upon ropes. Fortunately the men turned out less stupid than might have been expected, for they finally got their lesson so well, that we had no more trouble from this source, though we soon had worse grievances to urge against them.

We now began to descend, and at 12:30 reached a fountain, where we stopped for luncheon. After passing over undulating ground we entered a narrow gorge watered by a small stream; its careful cultivation indicated the neighbourhood of human habitations. This high region seems to enjoy a good deal of rain, for water was abundant, and the richness and freshness of the vegetation reminded us of the showery neighbourhood of Samsoun. We left the village of Dishek on our left, when we suddenly turned with the valley to the right, still travelling near the bank of the stream. Came to a fountain of very fine water, and proceeded through a charming valley full of flowers and fresh green grass, the fields being covered with standing crops of wheat. Harvest was just commencing. This spot is called Kamishjy Boghaz, or the valley of the

reed gatherers, and reminded us of the rich and beautiful vale which runs south from Tocat. Farther down the land was not equally well cultivated, and much of it is covered with dwarf oaks. Travelling near the bank of a stream, we entered a gorge, which soon turned to the south, and became very narrow and precipitous, stupendous rocks frowning on both sides, while the stream roared among the fallen stones at the bottom. We could no longer travel upon the water's edge, but climbing over a rocky road on the right, passed above a mill, and proceeded on the bushy slope of the calcareous mountain, the stream flowing at the bottom of a narrow and deep cut on our left. The difficult pass we had just gone through is called Devrend Boghaz. The view at this point is grand and picturesque in the extreme, and the place could be defended by a handful of men against the largest army in the world. Our path now led us into a broad valley, but we could see on our left the continuation of the deep fissure, at the bottom of which the stream continues to flow. After riding a while upon this sort of plateau, we rapidly descended into the fissure by a zigzag path trodden in the soil; there was hardly room for anything but the passage of the impetuous stream, upon which have been erected three flour-mills, at different points. The rock now stands boldly up on both sides, rising to a great height, but huge fragments are hanging about or have tumbled to the bottom, giving the scene a character most chaotic. The fallen rocks finally quite

close up the passage through the gorge, so that the stream escapes through a straight fissure, 10 feet wide at the bottom and 200 feet deep in height, cut smooth through the solid rock, as though by human hands. The path now leads through an opening to the right of the fissure, and the gorge slightly widens; then comes another chaotic scene, as though Titans and giants of stupendous height had fought and tumbled over the mountains and the hills in their wrath. The stream with difficulty finds its way through the cracks of this last barricade, dashing and foaming among the rocks; it then suddenly emerges into the great plain of Boghaz Keuy, which stretches out to the very horizon, and its waters henceforth sluggishly pursue their way among the remains of ancient cities. Our own path through this pass (Boghaz) lay among the chaos of rocks; limestone of a crystalline character, shales, conglomerates, and trap-rock, seemed to stare in amazement at each other, wondering what could have mixed them up so. I do not remember any spot that has produced a similar impression upon my mind. The northern edge of the mountain cluster I have been describing, from the Devrend Boghaz to the Lower Boghaz, near Boghaz Keuy, forms a pretty regular wall, running east and west, and constituting the southern boundary of the level plain, whose broad and fertile fields, covered with the fruits of man's labour, and studded with villages, present a singular contrast to the chaos of rocks from which we now emerged. I confess that while going

through the lowest part of the pass, I was constantly thinking of the third picture in Cole's famous 'Voyage of Life,' where the poor traveller is represented standing up with clasped hands upon his shattered bark, the guardian angel visible far away beyond the clouds, while the rushing stream of misfortune is dashing him onward toward fearful precipices, leaping into fissures of almost immeasurable depth; the stupendous cliffs hanging overhead, the chaos of shattered rocks, the broken trees upon the bank, and the very bend in the river, all was there; and far away, down beyond the whole, I could see the smooth plain stretching out to the horizon, occasionally darkened by the shadow of a passing cloud, not unaptly imitating the ocean of eternity, into which the little bark is soon to be ushered. I involuntarily said to myself: Can it be that Cole had visited this spot? So true it is that genius and nature both tend to the same ends, and produce the same glorious results!

As we came out of the Boghaz we landed upon a plateau occupying the left bank of the stream, where lie the remains of the great temple described by Texier, and of which Hamilton has given a very good plan. A minute examination enabled us to find only unimportant errors, referring solely to the internal communications existing between the different apartments. It must have been a grand edifice, and its high position, with a slightly inclined and extensive square in front, must have greatly heightened the effect. Bricks,

broken stone, and pieces of mortar, cover the whole plateau on the east and north, indicating that here lay the ancient city of Pterium; while a wall, protecting the temple on the south, extended as a line of circumvallation to the small forts on the west. The citadel or acropolis occupied the top of a mountain opposite, in a direction nearly south of the temple. It must have been a place of great strength in those days. The stream which comes down through the Boghaz, has hardly entered the plain when it receives a small tributary from the east, and running westward flows on towards Sungurlu. The present village of Boghaz Keuy, or Village of the Gorge, occupies both banks of the stream, about 300 yards from the temple; and there are here, also, many old walls and ancient remains. Indeed, one cannot avoid the conclusion that Pterium was once a rich, well fortified, large, and populous city. We crossed the stream over a bridge, and went to the Agha's Konak, a large establishment, in the old Dereh Bey style, facing the west, which we reached at 5. The Agha himself was not at home, but his brother received us with marked attention, gave us the best room in the house, and invited us to dine with him. We, however, made the most of our time, by immediately going over to see the ruins, which we minutely inspected. But they have been faithfully described by others, and particularly by Mr. Texier, who has thrown into the inquiry so much learning and acuteness, that I feel incapable of adding anything to

what has already been published upon the subject. I shall, therefore, merely state such items as have been omitted by my learned predecessors; for these ruins are, perhaps, the most remarkable and important that occur in the whole Peninsula of Asia Minor.

## CHAPTER XIX.

Detailed description of the ruins of Pterium — Forts — Subterranean passage — Carved rocks — Hypothesis respecting their meaning — Arrival at Euyuk.

THURSDAY, 4th.—An observation taken on the piazza of the Mudir's house enabled us to ascertain the position of Boghaz Keuy above the sea-level as 3515 feet. This is 900 feet below Yozghat, and, as we first went up on leaving the latter place, the descent from the upper to the lower Boghaz must be more than 1000 feet. It is also worthy of note that Boghaz Keuy is about 1000 feet higher than Sungurlu, as we shall see by-and-by, when we come again upon the water which flows by the ruins of Pterium, while the level of the Halys at Diashkhan is about the same. We took an old Turk for our guide, and started off at 7 A.M. to see the *lions* of the place, sending on our baggage to a village on the road to Euyuk. About one mile to the south of the Boghaz Keuy, we saw the remains of two small forts built upon isolated rocks, which rise from the general level. The foundation-stones were all we found in place, and these are regularly shaped blocks

of limestone and brescia, similar to those of the temple. We found an inscription upon the smooth and inclined surface of a rock in one place; the letters were about a foot high, but they were so badly injured that we could not distinguish their form. The ground here is more elevated than at the temple plateau, and the city wall, which passes along the south side of the temple, extends to this point. We now rode to the south, and passed over the first line of rocky hills which form the southern boundary of the plain, and which are much lower than at the Boghaz. There is here a small valley running east and west, and, following it eastward for some distance, we came to an entrance or doorway into a subterranean passage, which is built in a northerly direction toward the centre of the hill. The doorway itself is formed of three hewn blocks, two of which are set up perpendicularly, while the third lies across the top. Some building must once have existed here, as is evident from the great quantity of hewn stones now lying about in confusion. Having scrambled over these, we entered the passage formed of two side-walls of hewn blocks, set upright, but considerably inclined inward at the top, with flat stones for a roof. The height of the passage is seven feet, while the width is also seven feet at the bottom, but it narrows upwards. We advanced in this passage for a distance of 45 yards by measurement, when our further progress was arrested by a block which had fallen from above, and completely closed the way. Having examined the ground overhead, we thought it

resounded under foot for a distance of a mile to the east, and it seemed to us that the stones over all this space presented an appearance not unlike a vaulted roof. Beyond this the hill comes to a stop, and we there found the remains of a square fort by the side of an old road, which skirts the hill from the entrance of the vault. As no necropolis has been discovered near Pterium, it may be worth while to inquire whether this subterranean work, which crowns the hill on the south of the town, be not something of the kind. At any rate it would probably be not a fruitless undertaking to effect an entrance beyond the point of obstruction we encountered. This is quite a different excavation from the one visited and described by Texier, and which lies below, near the river, and in the old town. The square fort we found by the road-side stands on the edge of the hill, and a valley of some 300 yards in width separates it from the acropolis. The hill of the acropolis extends to the Boghaz itself, of which it forms the western flank. The ruins of the castle are visible from below, but the ascent is steep and difficult, and we had no time to spare. We therefore descended to the plain, and, crossing the river, rode eastward to the Yazili Kaya, or carved rocks. The place is about two miles from Boghaz Keuy; it is a sort of offshoot of calcareous rocks, which leaves the general line of the mountains that form the southern boundary of the plain, and advances north into it. The carved rocks are found in a recess in the north-west side of this limestone, and

are certainly highly interesting. There has been so much doubt and controversy respecting their character and origin, that I shall abstain from "darkening counsel by words without knowledge." This much, however, I may be permitted to say, with all deference to those who know better, that the isolation of the place and the very form and general character of these extraordinary remains, gave me the impression that the carvings are commemorative of some *one* event that occurred in their vicinity; that this was not a building, a place of gathering for often-recurring rites, but a monument and memorial of an occurrence which the parties concerned desired to impress upon the minds of their successors and descendants. On the next page is a carefully drawn plan of the relative positions of the carved faces of the rocks; the area enclosed by the lines is an empty and uncovered space; it will be seen that its extreme irregularity precludes the supposition of this having ever been either a tomb or a chamber. This will be made clearer if we remember that this recess is evidently formed by the accidental throwing together of very large blocks of limestone, of various heights, sizes, and shapes, which no human power could ever stir from their place, and of which the surfaces alone have been slightly smoothed over previous to carving; or rather, as these figures are in relief, the face of the rock has been cut away just sufficiently to form them, and the space between and around smoothed with

a chisel. There is not the slightest proof that a roof ever existed; all the evidence is the other way. Nor is there the smallest proof of a wall having ever existed across the entrance, but rather the contrary.

Plan of Position of Carved Rocks at Pierium.

Moreover the second passage is narrow and irregular; and this, besides some interesting carvings, contains rock-tombs. The following measurements will give an idea of the dimensions of these carvings. The breadth of the surfaces carved on these rocks by the hand of

man, at an equal elevation around the area, are lettered on the plan, and measure as follows:—

A = 40 feet.	I = 9 feet.
B = 17 feet.	J = 14 feet 5 in.
C = 4 feet.	K = 20 feet 9 in.
D = 11 feet 1 in.	L = 13 feet 8 in.
E = 18 feet 4 in.	M = 14 feet.
F = 17 feet 10 in.	N = 4 feet only of chiselled surface.
G = 23 feet.	
H = 7 feet.	

Making in all 124 feet and 1 inch of bas-reliefs. The line O, the entrance, measures 48 feet. The other passage is nearly parallel to the side N H, but branches into two: one portion turning irregularly to the right, while the other comes round to the left, and would communicate with the main portion did not the rock H block the way. The smoothed surface and nearly obliterated carvings on the block H are proof that it occupies its original position, and has not fallen into its present place since these carvings were made.

I must say that Mr. Texier's drawings are much more perfect than the original carvings, which are greatly injured by time, and they produce a materially different impression. He makes some clever guesses on doubtful points, but it seems hardly fair for him to make drawings of what he supposes carvings once to have been, and give them to us as faithful copies of their present appearance. It has seemed to me, therefore, that the reader would be glad to have a faithful

drawing, at least of the principal and most important figures in the group.

Hierum—Carvings on Rock 61

This is the central and principal group of the whole work. It evidently represents the meeting of a man and a woman, each of whom is followed by a long train of attendants, mostly of his or her own sex. The chief figures are represented larger than the rest, which is in accordance with both Assyrian and Egyptian custom. The King stands on what seem to be men with pointed caps, bending their heads forward while he stands upon their necks; the Queen and her son (?) stand upon panthers or leopards. Texier has figured a unicorn by the side of each; I did not succeed in making out what it was. I think the women all hold staffs in their hands. The double-headed eagle is worthy of notice here. This plate represents all the carvings upon the face marked G in the plan, and faces the visitor as he enters the arca. It is also the converging point toward which all the other figures turn their faces.

Carvings on Rocks E and F.

The six figures represented on the previous page are carved upon the face marked F in the plan. The two in the middle appear to be women, but they are badly injured. The last would seem an important personage from his abundant millinery and the ponderous emblem of the Divinity which he carries like a helmet on his head. The lower figures occur in the centre of the surface marked E in the plan. It looks like two men carrying an ark or boat, but is very much injured.

Carving on Rock I.

The two women here reproduced are the best preserved portion of the right-hand or Queen's procession, which appears to be composed of women, wearing lofty tiaras, with long robes girded around their waists, leaning on staffs and carrying flowers in their hands. They occur on the surface marked I in the plan. The figures

on the surface at J are badly injured, and K is very much broken down. But the Pontiff occupying the surface marked L, is the best preserved figure of the whole, and I have taken special pains to reproduce it correctly.

Carving on Rock L.

He wears a cap of felt (?) with a turban around his head, holds a sort of sceptre or staff of state in his left hand, and a sacred symbol appears above his right. The expression of his countenance is humble and devout. His features, and indeed those of all the figures, are regular and handsome. They certainly have nothing African about them.

The figures here reproduced cover the right side of the narrow passages above described as nearly parallel to the southern face of the carved recess, and almost communicating with it at H. The left-hand figure is

Carvings on right side of passage.

doubtless the Divinity of these people ; he wears their cap, has their large ears, but features more marked and harsh. His body is formed of four lions, the emblems of strength, the lower two of which have the tails of fishes. He is set upon a fluted pillar, and seems to avert his face from his worshipper. The latter wears an uncommonly tall cap, highly ornamented, and brings a child or youth, around whose neck he has passed his arm while he holds his hands within his. The emblem is the same as on surface L.

I have reproduced with great care a sculpture

which appears to have been uncovered since Texier's visit, occupying the left side of the passage, and nearly opposite to the last figures. It is by far the best preserved of these bas-reliefs, and quite uninjured, having apparently been but recently uncovered from the earth which hid it, being very low down. I was informed by our guide that it was uncovered by a Frank, who was taking photographs, and whom I suppose to be Mr.

Carvings on left side of Passage.

Perrot, a young Orientalist of great merit. The want of space, however, could not have allowed him to photograph the carvings in the narrow passage. The figures here represented are twelve soldiers, of whom I give but six, as they are exactly alike. Their regular features, large ears, peculiar caps and swords, like sickles, are the points which deserve special notice.

It is certainly highly interesting and instructive to be carried back so vividly to the men who lived here so many ages ago, whatever hypothesis may be adopted respecting the monument I have briefly described, and which is worth a long journey to see ; especially if the monument at Euyuk, which will presently be described, is included. It may be added in further explanation of the Yazili Kaya bas-reliefs, that the figures of the King and Queen measure 4 feet 10 inches in height. The other figures generally measure but 2 ft. 7 in. to 2 ft. 10 in. The figure of the Priest, however, on the surface marked L, is 6 ft. 4 in. high. The slab G contains seven principal figures and seven accessory, 14 in all. The slab F, 6 ; E, 7 ; D, 6 ; C, 3 ; B, 13. The surface A is smoothed over with the chisel, but contains no figures. The surface H is indistinct ; at I but 2 figures can distinctly be made out ; J, 7 ; K (?) ; L, 1 ; M and N have no figures, though they are smoothed with the chisel. So that this principal recess contains at least 59 figures ; the narrow passage has 14 more. Mr. Texier's hypothesis is the most probable I have met with. It does great honour to his ingenuity and scholarship. He supposes the introduction of the worship of Astarte, in Phrygia, to be here represented. I cannot imagine that there is any ground for the supposition that these carvings represent the conclusion of a treaty, or a peace between the King of Phrygia and the Queen of the Amazons, for all the emblems of the latter are peaceful and religious, and

the Priest himself seems to preside over the whole scene. The Queen presents a flower, and she rides upon a leopard, the well-known emblem of the Astarte of the Assyrians. In the King's procession, too, though soldiers appear, yet there are, also, priests and religious emblems. But it is singular that Mr. Texier should have passed over in silence one of the strongest proofs of the correctness of his theory, *i.e.* the Prince, who follows the Queen, also riding upon a leopard. He has an axe in one hand, but in the other he holds up a figure (which may be the significant emblem of an embryo). This Prince is no other than Cupid following his mother Venus. We must not be surprised, however, that Mr. Texier should have overlooked this point; for Mr. Layard has since done the same. In his remarkable book on the remains of Nineveh,\* he has given us a copy of a procession, in which priests carry the figures of their gods. He there points out, on the left hand, the Jupiter of the Assyrians seated upon his throne, and on the right hand Astarte, or Venus. But he takes no notice of a little child also seated upon a chair, which is borne behind the mother. This tracing of the worship of Cupid among the Greeks, as well as of Venus, to the Assyrians, through the carvings of Yazili Kayah and the Nineveh procession, was suggested to my mind by a carved gem or intaglio, which came into my possession since our visit to Boghaz

\* See Layard's 'Nineveh,' pp. 285-287, edition of 1867.

Keuy. It represents Venus, or Astarte, standing with a robe girded at various heights upon her person, and with her hands extended in attitude of adoration, while in the sky on one side is a star, and on the other the crescent moon. She wears a three-rayed crown upon her head. A globe stands in front of her, and behind her a partly veiled child is seated upon a chair with his hands also extended in attitude of adoration. The workmanship, I think, is Greek; but the figures are evidently foreign, and the work probably dates to a period but little subsequent to the carvings on Yazili Kaya. It was found in the vicinity of Smyrna.

As to the other carvings, found in the lateral passage, they probably belong to a somewhat subsequent period, although to the same nation, as is proved by the features of the countenances. The image of the god I believe to correspond to the Baal of the Phœnicians; but he has the Phrygian cap, which shews him to have become a national divinity. His worshipper is both Priest and King, for he wears the cap of royalty and bears the priestly emblem. He may be initiating the child into the mysteries of the worship of Baal, but it is more probable that the carving commemorates the offering up in sacrifice of some youth of noble or royal blood. There are tombs cut in the rock in this passage or gallery, which were probably appropriated to the highest of the priesthood.

The isolated and somewhat elevated nature of this spot would favour the supposition that it was fre-

quented by the people of the neighbouring city for the celebration of the rites of Astarte, and, either at the same period or subsequently, for those of Baal. The ground in front of the carved rocks is a smooth terrace, which commands a fine view of the plain and of the site of Pterium.

The forenoon was nearly spent when we finished our sketches and notes, and we now proceeded nearly north down the sloping plain to the village of Yokbaz, lying half an hour or two miles to the east of Boghaz Keuy, with a small stream flowing westward through it. Our men and baggage were already here, and we rested awhile in the shaded verandah of the head man's house; a dozen little children of both sexes seemed in the height of enjoyment, tumbling into the water and rolling in the sand under the burning sun, all in a state of nature, and quite unconscious of the impropriety. We left this place at 1:30, and took a N.N.E. direction across the plain and over undulating ground, wholly destitute of trees or bushes, but generally under cultivation; the people are just beginning to harvest their crops. At 3:30 reached a spring of bad water; half a mile to the right lay a Koordish encampment of several black tents, with their flocks feeding around. This is their *yaila*. The ground rising, we were shown to the north the steep rock on which is built the castle of Karahissar; the natives who had seen it praised it as something very "*antika*." Hamilton does not think so, and accordingly we did not go out of our way to see it.

Reached Euyuk at 5.45; it is a small village built upon a little hill, which is a spur from higher hills on the north. The houses are like all Turkish village-houses in this region, *i.e.* a single room and a stable adjoining. We chose one with a wall partition; it was well tenanted nevertheless, but the nights were too cold to incline us to pitch the tent. We lighted a great fire in front of the house for such of our people as preferred to sleep out of doors. A small stream, shaded with willows, passes at the foot of the hillock close to the village, and makes an extensive swamp below.

The rest of the long summer's day was spent in examining, measuring, and sketching the remains of a building of great antiquity, to which I believe Mr. Hamilton was the first to draw attention.

## CHAPTER XX.

Plan and description of the remains of an ancient building at Euyuk  
— Sphinxes — Rock carvings—Conjectures respecting the origin  
and design of the building.

EUYUK, *Thursday, Aug. 4th.*—I shall now proceed to give our readers a description of the remains of one of the most remarkable and oldest edifices to be found in Asia Minor. I regret that persons more learned in antiquarian lore than myself should not have had the opportunity of attempting the difficult task of tracing these to their real origin; but I shall do my best.

This building covers the south-eastern edge of the site occupied by the village. The whole hillock, however, contains traces of ancient buildings; but whether they all belong to this one edifice I cannot pretend to say, not having attempted to trace the walls beyond the immediate vicinity of the sculptures. And first, it is worthy of note that while the monuments of Asia Minor are generally cut out of rocks belonging to the limestone class—such as limestone, marbles, and breccias—this monument contains only black granite of fine grain and great hardness. This accounts for the

remarkable and uncommon preservation of these sculptures, whose sharp angles have stood the wear of time as well as the red granite monuments of Upper Egypt. Another general remark should also be made; all other bas-reliefs found in Asia Minor are rounded off at their edges, however rude their workmanship, while these, like those of Egypt, are angular. Some of these sculptures remain unfinished, and they show that the mode of operation consisted in tracing out the figures and cutting them down along the edges, which were allowed to remain straight and angular. I feel warranted in giving a full account of these interesting remains, as I have nowhere seen them described. Mr. Hamilton's visit was short and hasty, and I shall point out his mistakes; moreover his drawings are not complete.

The plan on next page will give an idea of the general form of the best preserved portions of this building, as well as of their size. The first objects which strike the visitor are two granite blocks standing erect and forming the two sides of an entrance or gateway. They are marked S 1 and S 2 on the plan, and face outwardly to the south-east, standing 11 feet 4 inches apart, with a threshold rising like a step. These blocks measure 15 feet in height, and 7 feet in width in one direction, and 7 feet 2 inches in the other. Each block has a large sphinx carved on its outer face (see *Frontispiece to Vol. II.*). The sphinxes are 7 feet 3 inches in height, and 4 feet 7 inches in width. They have been very much injured, doubtless by the

hand of man, the nose and mouth being entirely obliterated, but the minute ornaments of the neck and breast are in a perfect state of preservation. The ears also are well preserved. The head-dress is pure Egyptian.

Plan of ancient building at Euyuk.

I can hardly account for Mr. Hamilton's taking them to be "uncouth bird-like figures." I take it he was so little prepared to find Egyptian remains, about here, that it never occurred to him they might be sphinxes; yet he acknowledges the sculpture to be "in a very Egyptian style." It is worthy of remark, as an evidence of inferiority in the artist who cut these sphinxes, that one of the feet has five toes, while there are but four on the other. The blocks upon which these figures are carved, are single, the appearance of several pieces upon the one, on the right hand, being produced by

a crack in the stone which does not pass through to the other side. It is, however, impossible to ascertain the precise original height of these blocks, or consequently the height of the door itself; but it was probably 15 feet.

As you enter the gate, there is on the right side, the bas-relief of a double-headed eagle, upon whose heads rest two human feet, while the edge of a robe is also visible above. This is a fac-simile of the double-headed eagle of the Yazili Kaya; but I am inclined to conclude from its appearance that it was put here at a later period, and does not belong to the original work, which is not the case at the former. There was a similar eagle upon the left side of the gate, which has been almost entirely broken off.

It will be seen by the plan, that such portions of the building as may yet be identified by their foundations, had very much the appearance of an Assyrian palace. Upon entering at the gate, you walk along a corridor 11 feet 4 inches wide, and 30 feet 8 inches in length, at the extremity of which must have been an inner door. Here, however, we find the foundations of a wall built across the corridor, probably a threshold, which we can trace for a distance of 40 feet upon the right side, and 26 feet 5 inches upon the left. The remaining traces of foundations have been removed by the villagers, and they have erected their mud-houses and cattle-pens upon the area once occupied by this costly edifice.

We now return to the gateway in order to describe

the remarkable bas-reliefs carved along the base of the wall which runs on both sides of it. The gateway with its two sphinxes occupies a breadth of 20 feet 4 inches, whence the two walls form a passage to the door, 15 feet in depth, both sides of which are formed of carved blocks of granite. There are then two sharp corners, and the two walls stretch out for some distance on both sides. The lower tier of blocks forming these walls is yet standing, and is covered with carvings; but it is impossible now to say whether there were sculptures upon the higher portions. I could discover none upon the many hewn blocks with which the ground is strewn. Let us now proceed to describe these carvings, commencing at the corner formed by the block G, and going to the left towards A. It is this row of stones which is the best preserved, and they are all lying in their original places, occupying a space 32 feet in length. These blocks measure 4 feet in height, as do all those which formed the lower tier of both walls. I shall point out the spots where blocks belonging to an upper tier are yet standing in their places.

I begin with the outer face of the left corner block marked G 1, for its bas-relief is evidently the key to the whole picture. This face measuring but 2 feet in width, represents the image of a bull set up on a stand or pedestal. The work is vigorous and characterised by that knowledge of the animal forms, which is so strongly marked in Egyptian and Assyrian sculp-

tures; the muscles and folds of the skin are well delineated. The bull is proportionately too small to be a representation of a living animal; besides, its position upon the pedestal clearly points it out as an image.

Carvings at Eryuk (blocks F and G 1).

The hind-quarters of the animal are broken off, and the face is somewhat injured; but the work is, otherwise, in an excellent state of preservation, owing doubtless to the extreme hardness of the granite. The next block upon the left (marked F), is of the same height. An altar stands in front of the idol, broad at the top, and firmly set upon its widening base. It is divided into horizontal strips, alternately smooth and barred. Next to the altar is the figure of a priest or priest-king, or high priest, the counterpart of the figure already given from the Yazili Kaya, near Boghaz Keuy. The head-dress is the same, and so is the rod

or sceptre (?) curved at its lower extremity, which he holds in his hand. The other hand is extended in the same manner, the fist closed, and the thumb stretched forward, but it holds no religious emblem or offering. The dress is also the same, but the lower part of the figure is hid by the soil. There are, however, points of difference, too important to overlook. The features of the Yazili Kaya figure approach the Grecian type, while these are evidently Egyptian or African; the nose is flat, the lips protruding, and the chin extremely small. He wears an ear-ring, which is not seen on the Yazili Kaya figures. Behind him is the form of a female; her arms folded and resting upon the end of a staff, the fingers of the right hand raised upward as if in the act of worship, as the Orientals hold them in making the "Temena." The head-dress is high, narrowing upwards and flat at the top. The tresses of her long hair lie upon the ear, partly covering the ear-ring, and fall along the back nearly to the feet. A garment is wound around the body. Again the features are very decidedly Egyptian. If the reader will place these figures by the side of those of Boghaz Keuy, he will be able with his own eye to detect the points of resemblance and difference.

The next figures upon the left are on the block marked E, which measures 5 feet 8 inches in length. They represent a priest leaning upon a staff, wearing a wide-sleeved gown, and leading to sacrifice a goat which he holds by the horn with his left hand. There

are three oxen following. The carvings on this stone are remarkably well preserved, and their execution, espe-

Carvings on blocks D and E.

cially the animals, is superior to the other sculptures. This work appears to have been done by an artist of superior talent, for there is not only great truthfulness in the forms, but a spirit and life which does not belong to the others. The block D represents three priests in similar costume, long loose robes, with wide sleeves hanging from the shoulders, and the sleeves of their under garments turned up and lying in folds at the elbows. Their faces are broken, but it can be seen that one of them wears an ear-ring. The first appears to lead the way with a staff held in the left hand, while the right is raised in adoration. The second carries some instrument used in sacrifice, and in like manner holds up one hand, while the third lifts both. The feet of these figures are flat, the ends of their shoes turned upwards, and their legs are too small. It is impossible to say whether what is seen in front of each figure be a part of their dress or a distinct object, as a musical instrument. A block of the upper tier here lies upon the corner of the block D, and covers the whole of C.

The next block, C, is 4 feet 3 inches long, and represents a scene connected with the erection of this building. A man is ascending the ladder, probably a mason engaged in setting the stones in their proper places, aided by his companion below; while a third is standing with his back toward them, encouraging the workmen by playing upon an instrument very much like the modern "zoorna" (a species of hautbois, see vol. i. p. 248). They all wear short tunics tied around their waists with girdles

which fasten in a central knot; two of them wear ear-rings. Their heads are shaved with the exception of a curl which hangs in front, and in one case another which falls behind. The musician, however, wears a turban similar to those of the country farmers of the present day, with the end hanging behind to protect the neck from the sun. The features of all the three are again decidedly Egyptian.

Carvings on blocks A, B, C.

The block B contains a continuation of the same subject; exhibitions and music connected either with the dedication or with the erection of the building. Even at the present day, for public works such as a causeway, a bridge, the erection of barracks, &c., every town and village has to furnish a fixed number of workmen who labour gratis; and in order to keep them in good spirits while working without pay, the "davool," the "zoorna,"

and the bagpipe are called into requisition. When heavy articles are to be dragged the movements of the men are regulated by these instruments of music. The same thing is represented on some of the Egyptian monuments. In the present case we have two men dressed like the preceding; their heads, however, are too much injured to be distinguished. The right hand figure holds a long-tailed monkey in his hand, and is doubtless making it perform antics for the amusement of the crowd. The other figure carries a snake wound around his body, and is playing upon a guitar of a precisely similar form to that existing or found on monuments in Egypt.\* Ribbons are attached to the end of the instrument. The figures upon this block are finished, but the stone has not been smoothed down between them, indicating the steps of the process. It was evidently intended to draw and cut out a third figure on the left of these; but the work was left unfinished. It is also clear from this instance that the carvings were made after the blocks had been set in their places.

The last carved block on this side is A. It is a mere outline of a bull carrying a chest upon his back with a ring in front. The edge has been roughly cut out, but the block has not been smoothed around the figures. There is beyond the block A an additional smooth block; it may have been intended to bear also some bas-relief, which for some unknown reason was never executed. We have now passed in review the whole

\* See Wilkinson's 'Ancient Egyptians,' vol. i. p. 123, fig. 137.

row of figures from the corner of the block G; an important series which appears to throw light upon the whole work, and to indicate something of its origin and history. For, is it not the most natural conclusion we can draw, to suppose that the people engaged in this work were Egyptians, as the type of feature delineated clearly indicates, and that the building was in some manner connected with the worship of their god Apis?

But let us proceed to examine the rest of the sculptures. The portion of wall which extended from the corner of the block G to the left hand sphinx consisted of three stones: one of which, G, is in its place, another, H, lies in the passage way, and the third is lost.

Carvings on block G 2.

G 2 is the other sculptured face of the block which bears the image of Apis. It represents two soldiers, with short tunics, curled hair, and ear-rings, holding up

a standard. The forms are good, but the work is injured. The other group represents a priest in his robes holding an instrument whose form is too far injured to enable us to define it, while a naked youth stands before him, and holds his hand to his face. I believe that a human sacrifice is here portrayed as about to be consummated. I can see no other meaning in the group. The Egyptians are known to have been addicted to this crime in the earlier portion of their history.

Carvings on block H.

The stone H, which has fallen from its original position, is 6 feet long, and represents six men marching in procession towards the gate of the building; they wear tunics, fastened by belts, in which are placed their right hands, while the left is raised in the posture of worship, the fist closed, and the thumb extended

forward. Their heads are shaven, and they wear locks like the men at block C; their features are also decidedly Egyptian.

I have described all the figures lying on the left side of the gate, which are by far the most important and the best preserved. I now call the reader's attention to those on the right. The wall from the right hand sphinx to the corner of the block I is broken down. A prostrate block which may be seen in our general view (see *Frontispiece to Vol. II.*), contains remains of carvings, which are so badly injured that nothing can be distinguished. Whatever figures may have existed upon the southern face of the block I, have been totally destroyed. The eastern face of the latter, and a block adjoining, are now the only carvings remaining on this side; they are much injured, and seem of an inferior style of execution. It is not unlikely, however, that the bas-reliefs extended as far on this side as on the other. Indeed, the wall is better preserved here, both in its extent and the elevation at which it still stands. But the villagers have built on this spot a general wash-room for the village, and bath for their women, which begins at the edge of the block J. They have taken advantage of the ancient solid wall, from underneath which a spring issues, and have erected against it a square building of mud-bricks with a flat roof. We were told that there were figures inside of the bath upon the old wall; but as the place was full of women and children, who set up a shout when we came too

near, we could not muster the courage to break the laws of *Harem*. We, however, obtained a good glimpse of the inside in the early dawn, but what with the hard usage the face of the wall had received, the thick coat of soot it bore, and the darkness of the place, we did not succeed in distinguishing anything.

Carvings on blocks I, J.

The width of block I is 2 feet 8 inches. It represents a Queen with marked African features, seated upon a throne, wearing a necklace, and her head-dress and clothing generally bearing a close resemblance to the left-hand figure of block F, holding up her right hand precisely as the natives now do in making the salutation called "*Temena*," while her left hand supports an object which may be a sceptre. The execution is inferior, as may be noticed more particularly in her feet, which are entirely out of proportion. The points

of her shoes seem to turn completely over, backward, forming a ring; they rest upon a foot-stool. The next block J is 5 feet 8 inches long, and contains three figures in tunics, apparently playing upon harps, or other musical instruments. These forms are so much injured that the outline alone can be distinguished.

There is, however, one more work of the chisel of the ancients which remains to be described. Though not possessing the interest of the series of carvings already explained, yet, as a work of art, it is certainly equal to any of them. This is the block

Side view of Carving on block K.

of granite which is marked K in our plan, and measures 7 feet in its extreme length, while it is 3 feet 2 inches broad, and 2 feet 6 inches thick. It represents a lion that has just sprung upon a ram, and growls furiously, with his fore feet upon his prey. The

body of the animal, hind-legs, and tail, are cut in bas-relief on one side of the stone, while the front parts are completely carved out. The hairy portions of the body are represented by a greater thickness of the stone, while instead of a mane it carries heavy folds of skin. The work is original and striking. This block is evidently out of its place. It must originally have formed a corner piece, perhaps upon the summit of the wall. It now stands set up on end so as to constitute

Front view of block K.

a support for the bath house. In order to draw the front view, I was obliged to stand upon the roof over the heads of bawling women and children, and to look *down* upon it. It is worthy of notice that the emblem

of a lion *couchant*, resting his paw upon the head of a sheep, is frequently reproduced by the ancients in this region. There is a very bad one at the village of Yozghat, west of the Halys, and several occur at Angora. They are all of marble, however, the position is different, and the workmanship in the Greek style.

It is not my object to enter into a discussion respecting the probable origin and design of the remains at Euyuk. I have endeavoured faithfully to describe what I have seen, in order to furnish materials to others who are more competent to adduce conclusions that may be useful to antiquarian and historical research. I cannot, however, avoid carrying away some impressions of my own from this examination, and these have doubtless already leaked out during my description. These remains have been considered as of the same origin, and belonging to the same period as those of Yazili Kaya. I am inclined to think that the more they are studied the greater will appear the differences between them. It has been thought that the general form of the building proves it to have been erected by the builders of the palaces of Nineveh, and that they chose to adopt Egyptian figures and emblems. Is it not more probable that Egyptians adopted an Assyrian form of building? The turning point of the discussion, must, it would seem, lie not only in the sphinxes, but also in the features of the men, their costumes, their deity, the monkey (an African impor-

tation), and the human sacrifice, if we are right in so interpreting the figures on the corner block. There are certain portions of the dresses of these figures which may, with truth, be disclaimed as Egyptian; we refer to the shape of the shoes, and the striped or striated appearance of the Queen's dress upon slab F; but it is worthy of notice that the same peculiarities are met with upon the figure of Sesostris, near Nymphio; of which Herodotus asserts the Egyptian origin, and the point is generally conceded by the learned. The reproduction of these peculiarities upon the Euyuk sculptures may, therefore, be considered as a proof of the truthfulness of Herodotus. The double-headed eagles on both sides of the gate were, in my opinion, carved at a far later period; they are superficial, and so the upper portion has been entirely obliterated. They are a perfect fac-simile of the double-headed eagle of Yazili Kaya with the woman standing over it.

I am of opinion that the building at Euyuk is of Egyptian origin, dating far back, to the earliest conquests of that people. The march of Sesostris, so far as we are able to trace it, followed the coast-line at a short distance from the shore. He passed by Nahr el Kelb, the Plain of Issus, the shores of Lycia, and the Passes of Tmolus, near Sardis; in one word, he pursued the same route as Alexander the Great, only in an opposite direction. This place may be considered as evidence in favour of some of the conquerors having made an

inroad, established themselves in Phrygia, and there built a temple to the gods of Egypt. Their stay, however, was short: they left their work unfinished, and the people of the land dedicated the building to the subsequently-introduced worship of Astarte.

## CHAPTER XXI.

Town of Sungurlu — “Arpalanmish” — Orchard encampment — Protestant Armenians — Village and mosque of Aghajü Koyoonoo — Females pounding wheat — Corn-pits — Salt-pans — Villages of Kara Bekir, Yaghliü, and Izeddin — Without a guide — Advantages and disadvantages of an official guard — Single and double-humped camels — Cotton culture — Mode of providing fuel — Construction of chimneys — Presentation of a relic.

**F**RIDAY, *August 5th.*—We rose very early and spent the morning in continuing our observations and drawings of the interesting remains at Euyuk. Left at 9-30, and went across the plain to the W.S.W. In the afternoon our languishing guide took leave of us and turned to the left into a lateral valley, which he said would lead him by a shorter road to Yozghat. At 2-45 entered a narrower valley, thickly planted with vineyards and orchards. Saw a hill where the standstone strata were perpendicular. The rock possessing various degrees of adhesiveness, the crest of the hill had become curiously furrowed. Some similar hills, seen at a distance, presented the appearance of fortifications and of ruins; but on approaching we perceived them to be the effect of natural causes. About 6 P.M. we came upon the town of Sungurlu, whose narrow and filthy streets and dilapidated houses are erected upon a rise of ground

on the right side of the plain, and overlooking it. Sent a man to the Mudir to announce our arrival and ask for quarters, and promenaded about town visiting several houses, the filthy condition of which discouraged us from accepting the offer of hospitality. One of these belonged to a prominent member of the Mejlis. When we walked upstairs to examine the cheerless and dilapidated rooms, we found the proud owner of the mansion sitting crosslegged on a carpet in the verandah, his feet naked, too busily engaged cleaning his toes to look or see who had come. We finally settled down at what seemed a more respectable set of rooms, where we found before night came on that we should have to fight against three distinct species of enemies who were determined to taste foreign flesh. It seems, however, that our comfortless condition was not owing to any want of goodwill on the part of the authorities. The Mudir sent his chief officer to give us a welcome and see that we had all we needed.

The feet of several of our horses are in a bad condition; the natives call it *arpalanmish*, and say it is owing to the horses having no time while thus steadily travelling to eat any straw with their barley; others say it arises from their drinking while on the road; and others again, from their stepping into water while their feet are greatly heated and dusty. The fetlock is swollen even with the hoof and first joint, and one horse is so lame in all his feet he can hardly step. He was bled this afternoon, but it seemed to do him no good. We

keep these horses as cool as possible, and give them grass to eat; for it is evident we shall be detained in this place for a day or two. Took an observation with the barometer at even; this, compared to several observations taken the two following days that we remained encamped in a garden below the town by the river side, gave me 2528 feet as the elevation of Sungurlu above sea-level. This is about 1000 feet below Boghaz Keuy, and nearly 2000 below the city of Yozghat. The respective elevations of Sungurlu and Yozghat very nearly correspond to those of Tocat and Sivas; and there appears to be much the same difference of climate, if one may judge from the productions of the soil.

*Saturday, August 6th.*—The Mudir himself called early this morning with a considerable retinue. He seems a somewhat intelligent man, and had many inquiries to make, as usual, about European news and the war in America. We requested him to procure us a good camping-ground in the vineyards; he gave us a guard, authorizing us to choose any place we liked. We went through a part of the Turkish quarter and down to the bed of the stream, which is now very low and can be crossed upon stones without wetting one's foot, and found an enclosed ground, where a vineyard had formerly been cultivated, and well shaded, close to the river bank and by a spring of good water. There were trees all around, and a thickly-planted orchard afforded fine shade for the hottest part of the day. We pitched our tent under a tree, having found that it is

not otherwise habitable in the middle of the day. Orioles, here called "*Sarù sandál*," were singing in every direction; and, desiring to be relieved of the never-ending repetition of chicken boiled or roasted, we soon had twenty-six of the beautiful creatures smoking on the fire. The night was fine and refreshing, and oh! so different from our last in the Turkish Conak! The weather continues charming; the moon is new, and we shall have still to wait before we can travel in the night. Our present day-travel at this season of the year is trying, as the heat is sometimes very oppressive, especially when nothing green relieves the eye from the sun's glare; but we have the advantage of studying the country, which, in the brightest moonlight, we could see only for a short distance around us.

*Sunday, August 7th.*—We have a fine refreshing breeze from the north. Among the company who called at our tent we had the satisfaction of seeing several of the Protestant Armenians of the place. There is a small number of these people here, and a preacher is kept at this place by the Missionary of Yozghat; but he is now absent at Cæsarea. I went up to the house of a Protestant family in the Armenian part of the town, and spent several hours with them. There were twelve persons present in all—men, women, and children. They were poor and ignorant, but appeared to take great delight in the Word of God. In the absence of their preacher I held the usual Sunday service, and they were very attentive to what I had to say. They

have succeeded in purchasing a very eligible piece of ground for a chapel, at the moderate sum of 10*l*. On my way back to our tent I saw an ancient sarcophagus of marble, of excellent workmanship, but badly injured, now serving as a trough before a fountain. There is an ox's head at each corner and in the centre of each of the longer sides, with garlands of flowers between. Later in the day several members of the Mejlis called at our tent.

*Monday, August 8th.*—Two days' rest and a change of diet having materially improved the condition of our horses' feet, we started this morning at 5.15, and followed the valley in a westerly direction. The only guide we could obtain was a man who could accompany us no farther than to the next Mudir, whose head-quarters are at a village ahead. We ought to have insisted upon the Yozghat man continuing with us to Angora. At 6.50 passed the village of Chiflik on our right; it lies near the river, and is surrounded by gardens, orchards, and vineyards. We continued to pass over alternate hillocks and small valleys running down to the principal valley on the right; the country is destitute of every green thing—not a bush in sight, but only parched grass and soil, or partly gathered grain. At 7.50 passed the cemetery of Yorghanlù, which lies a quarter of an hour on our left. The river flowing along the valley on our right is called Delijeh; it is said to receive the waters of the Birdoghosoo, at or near Sungurlu. Two villages were here pointed out to us by the river side, called Yokaru

Beshboonar (upper five springs), and Ashagha Beshboonar (lower five springs). At 10 we reached Aghajū Koyoonoo, a respectable Turkish village, lying a little to the right of our direct road across the last-mentioned plain. We looked for a suitable camping-ground among the vineyards, but as we did not find sufficient shade, the hospitable villagers led us to the piazza of their newly-built mosque, whose northern exposure both afforded us shade and enabled us to take advantage of a refreshing breeze. These simple people seem to take great pride in the house of worship which they had evidently raised by their personal exertions. It is a solid stone building of one story, the interior woodwork unpainted; indeed there was little within but a small pulpit and a platform near the door. They showed no bigotry about our going in, and the place being cool, we stowed away some fresh provisions in it; some of our people even slept inside. We could see no rock *in situ* between Sungurlu and this place. The soil is reddish all the way, and the pebbles are limestone and shales. But the mosque is built of hewn sandstone, for the most part red, but some of it is grey. We found two ancient pillars of brescia. The red sandstone, being the softest, has probably decomposed and given its colour to the soil from here to Sungurlu, while the harder rocks have remained. The public square of this village lies by the side of the mosque, and here the flocks are collected every morning and evening when led to and from pasture. We took a

stroll over this place after our mid-day nap. The dogs were rather savage, but we kept them off with our long whips. The wheat and barley are collected in heaps (*harmans*), ready to be trodden by the cattle and to be separated from the chaff by tossing up in the wind. There are good horses here, and we particularly admired some of the mares of Turkman breed. There is a village stone mortar, of large size, by the mosque, in which two women at a time pound wheat, previously moistened, for the purpose of making "boorghoor," a substitute for rice all over the interior, which they cook in the shape of pilaf, soup with broth of sour milk, or dolmas of stuffed vine leaves. It is considered very good by those who like it. These women use a long stick or pestle, for the purpose of pounding the wheat, which they do standing upright. They are dressed in gay colours, wear long silver ear-rings which hang down to their shoulders, and some of the younger ones are not bad looking.

*Tuesday, August 9th.*—We slept well in the piazza of the mosque, being incommoded only by mosquitoes and sandflies, which we kept off by spreading our handkerchiefs over our faces. A portable net, spread out by means of a little hoop, or a couple of sticks, so made that it could be hung up by tying it to a nail or rafter, would certainly be a great convenience. Started at 5.45, and soon came upon hills of gypsum, which extend southward as far as the eye can reach, and doubtless once formed the bottom of a lake. Passed Choghoon ;

in this and other villages, we find that grain is stowed away in a hole made in the ground, ten feet in depth and six across; it is then covered with sticks and earth. The soil must be very dry to allow such a process to leave grain uninjured. These holes are left open after the grain has been taken out, and are very dangerous places for strangers. Went up the hill, which is covered with a stunted growth of green bushes, and a very interesting and striking prospect broke upon our view when we reached the summit. We were standing on the brow of a very steep cliff, which continued of similar form toward the west. At the bottom was a narrow valley, through the centre of which flowed the Delijeh Urmak. This valley was bounded on the north by a sea of red sandstone hills, whose abrupt sides came suddenly down to the river. Right under our feet were extensive salt-pans, into which flows the water of a spring issuing from the gypsum hills on which we stood. All the hills on this side being of white gypsum, and on the other of red sandstone, the contrast is very striking. The stratification of the sandstone is very marked, but slightly inclined, and waving. Came down the hill by a very steep road, having to dismount for the purpose. We at once repaired to the salt-pans, and found the process of desiccation going on in the simplest manner. The salt was dried and piled in the pans or shallow tanks nearest the dry land, and causeways enabled the workmen to bring in the water and cut it off for evaporation. Where undisturbed the salt had

formed very pretty crystals of considerable hardness. The spring which supplies these pans issues from the steep hill-side, only 100 yards off. The whole apparatus is not extensive, and lies on the very edge of the river, which must occasionally rise over its steep banks, if signs we noticed are not deceptive. We stopped at a hut close by, where the owner has his workmen and superintendents. A Government official also is here, to collect a tax. The people were very polite and did all they could to detain us; they informed us that 250,000 okes of salt are obtained here every year. This place is said to be six hours from Sungurlu. We soon crossed the river upon a wooden bridge, and perceived that the gypsum on the south side of it has red sandstone lying beneath it. This is a repetition of the formation of the Sivas basin, where, on the hills south of the plain or valley of the Kizil Urmak, the red sandstone is clearly seen to underlie the very extensive formation of gypsum for which that region is remarkable. At 9 we came upon green shales, evidently underlying the red sandstone. Reached the village of Kara Bekir, which had been hid from our sight by some projecting rocks. The stones and rocks here are all of argillaceous shales, and very much tumbled about. We climbed up into the Mudir's tall house, where we found a number of Turks of high pretensions collected together. We took things in a very "*sans façon*" style, however, made ourselves at home, had our luncheon brought up, and occupied the sofas, to the evident

disgust of some of the anti-Giaour dignitaries, who made themselves scarce as soon as they had stared at our dusty party as long as their dignity would allow. We found the Mudir himself was absent, having gone off to the neighbouring villages to attend to the settlement of some Circassian emigrants. Our Sungurlu guide had to leave us; but two men on horseback were pointed out from the window, who were going as far as the next village, and would show us the way. The said next village was described as a charming place for a camp, abounding with gardens, walnut-trees, orchards, &c., enough to make our mouths water. Poor innocents! I never could understand, however, what object they had in deceiving us, unless some Frank traveller had imposed himself upon them and gone off without paying his bill, and they, thinking we might do the same, used deception to get us off. I think, however, it would have been hard to keep us here; so we went off at 10.15, following the distant scent of the two riders ahead. At 12 reached the small and miserable village of Yaghlù, where we found a crowd of *zaltiehs* and villagers at the door of a miserable hut, whence we concluded that our hoped-for Mudir was there holding his court. Without dismounting from our horses I sent in one of the young men, whom the official informed he had no man to spare, but that we might go to the next village with the two guides who had led us from Kara Bekir, and we should there find another Mudir, who would furnish us a guide to go on. So we started

off again down a small hollow and up a hill through a beautiful little oasis of gardens and vineyards, watered from a single but abundant fountain. We now entered a high plain or plateau, extending as far as we could see, and shut out from the rest of the world by a slight rise of the ground. The high rocky hills we had had on our right from the salt-works receded and entirely disappeared. The soil seems very rich and somewhat clayey, with very few stones in it. The crops have been gathered in and heaped near the villages upon the threshing-floors, so that all around us looks like a dreary desert. Not a tree or a bush is in sight. We turned slightly to the left, having long ago lost sight of our two guides, who stopped at the fountain, and, being conducted by our own instinct and the plain road before us, found the little village of Izeddin, containing a dozen houses, built on the slope of a hill facing toward the south. We asked the way to the Mudir's house, and not finding him at home, took possession of his empty quarters and occupied two comfortable rooms upstairs, with a good piazza, putting up our horses in the stable below. It was said this Mudir, too, had gone to attend to the settlement of the Circassians. There was no one to represent him but the Kiahaya of the village, who had no power to act. As for the splendid gardens we had been told of, there was not a bush or a leaf anywhere in sight. No more was the *nalbant* visible, who was to attend to the foot of one of our horses who had begun to show lameness, having been badly shod at Sun-

gurlu, as it was thought. We were nearly starved, too, for no one would sell us anything; but the men being gone, we obtained several chickens from a woman by craft, for the poor creature thought we did not intend to pay her; so we shot them first, and then, to her agreeable surprise, paid for them at her own price. Tried to make a bargain with a man to serve us as guide, but his pretensions were so high that we gave it up, and I promised the party to conduct them safely on, which promise I kept as far as Angora, though I had never seen an inch of our route before. It is but fair to say, however, that the road was very plain, and there were so many people working in the fields that we should easily have been set right had we gone out of the way.

*Wednesday, August 10th.*—Started this morning at 5.10, without guide or guard. As for the latter character, which is the one principally claimed by these men, I have never found it of the slightest avail. In such encounters as I have had, or have heard of, with highway robbers, I never found *zabtiehs* to be of any use. They are the first to run away, and I have known several cases in which they were in partnership with the robbers, and have been the first to attack the party placed under their charge; not unfrequently they have themselves turned robbers and plundered the persons they were sent to protect. On the other hand, however, the mere sight of a *zabtieh* accompanying travellers produces the impression that

the latter have friends of high standing and influence, who would punish any one who should attempt to injure them. Then, too, foreigners rarely pass through the country; extravagant ideas are generally entertained concerning them; the ignorant rustics are very much given to exaggeration, and while a lonely Frank traveller would be thought only a poor devil who may be plundered by all who meet him, a party with a police officer at the head is supposed to contain some consular or military dignitary. And again, the exactions of the *zabtiehs* keep the rural population in constant dread of them, so that one of these men will secure to you the best quarters in a village, and whatever provisions the place affords. You only need to see that everything is strictly paid for, and that the official takes no unwarrantable liberties with the poor people. On the whole, it is my decided opinion that when a European or foreigner has been several times over the same road, and is known to the natives, he will gain nothing whatever by encumbering himself with one of these men. But when he travels over a new road he will find it wisest to submit to the unpleasant necessity. The encumbrance is necessary; it will pay. But he should take a man from the capital of one Pashalik to another. As a general rule, these men, receiving monthly wages from Government to act as mounted or foot "gendarmes," or as messengers, are allowed to accompany a traveller as a special favour, the expedition being considered a holiday; the traveller

feeds them and their horse, and gives them a present at the end of from 5 to 10 piastres a day: prices differ in different provinces. There are places, however, where the whole support of the *zabtieh* is thrown upon the traveller, and Government stops the man's wages during the trip until his return; it thus becomes a really expensive luxury which one should certainly dispense with if he can.

On leaving Izeddin our direction continued west. Passed a collection of black Koordish tents, whose flocks were feeding in the low grounds; and were attracted by the sight of two camels of the two-hump species feeding among the bushes and guarded by some men. Went up to them and found them to be very fine animals, both females, one of which had a male colt of the same breed. The humps on the back were extremely high and conical; the hair was longest at the top, and one hump hung over on one side. The men who had charge of them said they were never saddled, but kept entirely for breeding purposes, the cross of this breed with the common one-humped camel being generally considered best fitted for Asia Minor.

This was the first time I had seen the bare back of a double-humped camel in this country. Having spent by far the most of my time during the last twenty-five years in the north-western part of Asia Minor, where the camel is not a very common animal, all my efforts to see the creature had proved unavailing. I had fancied that I might have seen him with his back covered over

by the pack-saddle, which hid his humps. But I was now inclined to believe I had never met him before. I had asked many Koords and other keepers of camels about this species; they all professed to have seen it, and several said that some of their own camels, now away, were of that breed, but when I asked them what was the difference between the two breeds, they only returned evasive answers. Some said the males are all two-humped; others, that they get two humps when fattened and not allowed to work, &c. Since I examined the two camels we now saw, however, I have had abundant means of judging as to the correctness of these statements. This is the Bactrian camel, capable of enduring the cold, and introduced into Asia Minor solely for breeding purposes. A yearly supply of camels comes from Mesopotamia; they belong to the Arab breed, are tall, one-humped, short-haired, and of a light colour. They are sold on their arrival for as low a price as 7*l.* and 8*l.* apiece. But they are not accustomed to the cold of the climate, nor can they travel in mud or climb mountains. The cross between them and the Bactrian camel produces the best breed for the climate, and has but one hump. This improved breed reproduces itself, but is apt to degenerate, and is renovated both by fresh importations from Mesopotamia and the crossing of the Bactrian, which is kept in all the southern portions of Asia Minor in small numbers for this purpose. The Bactrian breed itself is kept pure by means of a few females that are never loaded or

ridden. The notion, that the dromedary is the two-humped camel, used only for riding purposes, the two humps serving to keep the rider from falling in front or behind, while the one-humped camel is a beast of burden, was long ago exploded. The dromedary is any camel which is used for riding purposes; any camel may be made a dromedary or a pack-camel as the owner thereof chooses. But there is no more ground for dividing the camel into two species, one of which shall be called the dromedary, than there is for dividing horses into distinct species according as they are used for riding or for the pack-saddle.

A little further on upon this road a herd of common camels was feeding in the fields on our right, all bare-backed and one-humped. My attention was attracted to one of them, a female, whose single hump was extremely tall and conical, and hung half over on the left side. It presented exactly the same appearance as the humps of the Bactrian camel. It was evident this creature was allowed to feed, and had no burden put upon her. Moreover, it is a well-known fact that the common camels which are used as beasts of burden, when overworked, become thin and lose their humps by the month of March; their saddles lie flat upon their backs, and these are sometimes one continuous mass of sores, making the poor animal roar with pain when being loaded. I have sometimes seen the driver cut off pieces of flesh from the camel's back with his knife to keep it from mortifying. In summer, however,

the camels have more feed and suffer less from exposure, and by autumn they get as great a hump again as they ever had. This lump of fat, or natural saddle, upon its back, is one of those remarkable provisions by which Providence intended to prepare this animal for the service of man; and so are the callosities upon his legs, and the skinny cushion on the middle of his breast, by which he is able to rest his weary body upon the ground. Those who deny such a Providential arrangement reject a most logical, simple, and beautiful explanation, for the sake of launching themselves into a sea of doubt.

About an hour later we came upon the telegraph line which passes between Yozghat and Angora, and were destined to keep it almost constantly in sight until we reached the latter place. We now descended into a fertile valley, where the fields were planted with cotton; this was the first sign we saw of the extensive cultivation of cotton which has been attempted since the price of the article was raised by the blockade of the southern ports of the United States. These plantations, however, did not appear very promising, and the expense of transportation to a sea-port must be great. We shortly reached some threshing-floors on the side of this fertile valley, and stopped at a fountain where several men were gathered to witness and help in the shoeing of several oxen previous to their treading the wheat. This operation is rarely practised here; the cattle being small, the shoes, which are double, are

necessarily quite small. At 11·30 we came upon the river Halys, last seen at Sivas; it there sweeps down towards Cæsarea, whence it gradually bends its course to the Black Sea, which it reaches west of Samsoon, forming a long low and marshy delta, which projects into the sea. It here runs northward. At noon we reached the village of Diakhshan, built some 150 feet above the level of the river and 200 yards from the bank. It lies on both sides of a small hollow, and is larger and better built than most of the villages we have seen. Some of the houses have two stories. We were taken to comfortable quarters, and took possession of an ample piazza with a surrounding railing, where we hung up our shawls and thus obtained excellent lodgment for the night. Just before arriving here we saw a jerboa run across the road; it moved with great rapidity, and its leaps succeeded each other so fast that it appeared to run instead of leaping. This is the first I have met with except in the neighbourhood of Tocat, where, however, they are not common.

As we advance on our journey and come to regions entirely destitute of trees, we are struck with the measures adopted by the natives for providing themselves with fuel. We have been looking from our piazza at some of the women collecting the manure from the track which the cattle follow in going to pasture in the morning, shaping it into round cakes some 6 or 8 inches in diameter, by handling it as they would a lump of dough, and sticking it on the walls of

their houses to dry in the sun. All the dwellings around us are thus more or less ornamented. The women seem to enter upon this duty with a matter-of-course air, and conduct it with an artistic dexterity, which proves that it is one of the accomplishments of the housekeeper in this region. The fuel whose manufacture has been described, after being dried, is stowed away in a store-room kept for the purpose. The foundations of the houses are made of large stones, but large mud bricks are employed for the rest of the walls. The chimneys are made of the same, and have a flat roof like the house itself covered with clay. Near the bottom of the chimney, as it issues from the roof of the house, there is on either side a triangular hole for the purpose of allowing the smoke to escape. The upper portion of the chimney is of course hollow within, and must serve as a sort of reservoir for the smoke which cannot immediately escape by the holes.

Yesterday morning, as we were getting into our saddles, a Turkish woman came up to me with a string in her hand, and asked me for something to hang to the neck of her child, which was sick of intermittent fever. Being in a sportive mood, and in a hurry besides, I pulled off a single hair of my beard and gave it to her. She said it was very little. I told her I could not spare more, as it was very precious; and she went off much pleased, holding it up high as something very valuable. Though we found our way to this village without difficulty, yet we experienced much backwardness on the

part of the people to furnish us with what we needed, there being no *zabtieh* with us. We now generally have to advance the money before the article wanted is produced. We are here informed that the distances this way from Izeddin (our last stopping-place) are as follows : From Izeddin to Balashuklu, 2 hours; Memetly, 5; Karajalù, 6; Kuruk, 7; Diakhshan, 8. The road we are following is not the one put down on Kiepert's map, for we pass south both of Kiskin Dag and of Koorbaghulù.

## CHAPTER XXII.

Village of Yozghat — Antique marbles — Angora goats — Village of Ofra Keuy — Manure fuel — Feast on apples — Description of Angora — Catholic Armenians — Religious persecution — History of Angora — Deserted houses — Armenian monastery and cemetery — List of Europeans buried there — Persecution of Protestants — Peculiar atmospheric phenomena — The Protestants of Angora — Religious service — A converted Turk — Ruins of Castle — Temple of Augustus.

**T**HURSDAY, *August 11th.*—Left our quarters at 5-10. Crossed the river and had considerable amusement at the expense of such of our party as were not much experienced in fording. Three boys were crossing on a donkey at the same time, and it seemed as though they would be carried down by the current. Our three-months-old colt, the pet and plaything of the party, went through mostly by leaps. He is growing so tall he can no longer pass under his mother, though he managed to do so for a week after we left Tocat, the mare lifting her back to allow him to do it. I have been giving him an oke of milk every morning and evening, of which his mother tries to get a share and sometimes succeeds. They both continue in excellent condition. No horse of the company can keep up with her at a simple walk; and as for the colt, he

would keep ahead of everything were he not so fond of society.

After crossing the river, which we found to be 2571 ft. above the sea at this place, we went over a high mountain and down into the village of Kà-lùchlar (swords), then crossed a valley and went up a narrow gorge on the other side ending in a steep ascent; we again gradually descended along the face of a limestone hill, passed a fountain at 8·25, and after riding on level ground for a mile, our road began to rise. Continuing our journey, we pursued the windings of a narrow gorge, where the sun's rays came pouring down reflected by the barren rock around, and went up a steep ascent still more trying to our horses. Another narrow gorge now lay before us, shallow in front, but growing deeper as it receded to the right. The village of Yozghat is built on the further or western side of this gorge. We went down into it and found, at 9·40, in the yard of the only mosque in the place, a comfortable shelter from the oppressive sun. Of all dreary localities this is the dreariest we had yet seen. The miserable dwellings are built over each other on the steep hill side, the flat roof of one house being a front yard for the next one above. Nothing is visible around but barren and calcined limestone rocks. There was, to be sure, a fig-tree in the mosque yard, and we rested well enough on the piazza of that respectable building. There are here several antique marbles, one representing a lion crouching,

and a rough altar with clusters of grapes upon it. This place is said to be four hours from Diakhshan and eight from Angora. Its elevation is 4100 feet,

Sculptured Lion at Yozghat.

being 1529 feet above the Halys at Diakhshan. Thus it appears that the valley of the Halys is considerably lower than the country on both sides of it. From Yozghat we journeyed through an undulating region and in two and a half hours reached two mills, whence passing on we found the hills covered with dry grass, but the valley fresh and green. The hills are mostly of clay slate, some fine specimens of the argillaceous slate used in Europe for roofing being occasionally met with. Saw five very handsome Angora goats, whose silken hair had not been cut, and almost touched the ground. This animal is so much shorter on his legs and every way smaller though stouter than any ordinary goat I had seen, that I inquired whether

these were not young goats, but was assured of the contrary. They were feeding on the edge of the plain and not seeking the rocks as other goats do. We find trees as we descend the valley, and now meet willows planted in regular rows on the banks of the stream. Passed a gushing fountain and the village of Lench; it is eight hours from Diakhshan and on the right of the road. The valley about here has many trees; the people are engaged in carrying loads of freshly cut grain to their *harmans*. At 6.15 crossed from the right side of the valley over the stream, and entering a narrow gorge, went into the miserable village of Orta Keuy about seven. Willie's horse had been growing more and more lame all day. The last hour or two he brought down his nose almost to the ground every step he took, giving the little fellow anything but an agreeable ride; but as no other arrangement could be made, we went on, and the little rider bore it with remarkable endurance. Our quarters at Orta Keuy were about the worst we had yet had, nor were the people remarkable for their hospitality. What particularly struck us here was the immense quantity of manure fuel manufactured. It is made of two kinds, the first of simple cow's dung, which the women are constantly engaged in forming into cakes, as before described. The other kind seems to be about 14 inches in diameter and 3 inches thick; judging from its regular shape, it is probably a collection of stable manure moulded on the housetop as they make mud bricks. When some-

what dry, they turn them over. I noticed one of the fair sex on a long roof of a house opposite, in an uncommonly brilliant suit, walking with apparent complacency among vast quantities of the larger cake, probably the fruit of her own toils, which she was turning and arranging; I presume she was reflecting upon the enjoyment she would derive the coming winter, or the profit she should make by sale. We took up our quarters upon the roof of a house, and ate our supper by moonlight, but slept within, not venturing to expose ourselves to the night air.

*Friday, August 12th.*—Started at 5:20, Willie's horse still limping very badly on his forefoot. Recrossed the valley and stream over the bridge we had passed last evening. Our route lay along the northern edge of the valley which becomes still better cultivated as we proceed, and we saw a number of Angora goats feeding on the slope of the low hills on our right; they were eating the dried up grasses with which the otherwise barren earth is here covered, and many of which seem to partake of the character of aromatic herbs. Entered a road in the valley itself, which is lined and well shaded with trees; orchards on our right and left. Saw a Turk and his family gathering apples from the trees; we called them, bought some of their fruit, and all fell most ravenously upon it, having eaten nothing but meat and rice for a long time past. We had been deprived even of bread after using up the supply procured at Yozghat, for the thin cakes of the country were quite

raw, and after vainly endeavouring to accustom our stomachs to this kind of bread, and finding it impossible to digest, we had given up the use of farinaceous food. At 7.30 crossed the river by a bridge of hewn stone, and travelled awhile over a paved road in a very dilapidated condition. Left the valley to our right, and passing over a small ridge, obtained our first view of Angora, the ancient Ancyra. As seen from the east, it presents the appearance of a long and narrow hill, whose flat summit is covered with walls and towers. This hill slopes down on all sides except the north, where it is precipitous, with the river passing at the foot of the cliffs, embowered in leafy verdure. The town spreads to the greatest distance on the western side, which was not in sight. What we saw extended to the foot of the hill, and ended in a well-defined outline as though there had once been a wall there. The quarter of the city presented to our view is occupied by Turks, and appeared for the most part in a ruinous condition. The Rayah quarter is on the west next to the fortifications and within the first wall; the lower part of the town on that side is occupied by the markets and the Muslem population. Entered the town at 8, by the south-east gate. It is made up of fragments of old buildings, chiefly marble; a broken marble lion stands on each side. Went up the steep streets paved with trachyte to the open space between the upper part of the town and the fortifications of the castle, and passing over the brow of the hill, wedged our way through a

crowd collected by a fair, and reached one of the principal khans, a solid stone building occupied by merchants for business purposes. We had a letter from an Armenian gentleman in Smyrna to one of the principal Catholic Armenian merchants of Angora; we found he was lying sick at home, but his son received us very politely at his office and entertained us until our quarters had been made ready in town. After an hour we were conducted to a new wooden house that had been hired for us; it is built on one side of a small square or enclosure, which formerly made a khan, but has since become a court with private dwellings which are erected on three sides of it, with a low wall and gate upon the street. Some of the principal Catholic Armenian families have their residences here, and among them the person to whom we were recommended. The houses of the Armenians are built after the model of the Constantinople houses. Ours has but one room finished; there is a small room or kiosk on the top of the house whence we have a very extensive view over this part of the town and the surrounding country. Remains of ancient art and splendour are met with at every step, more so than in any town I have visited in this land. But they are only fragments, while no building has resisted the destructive effects of time. Our first concern was with the outer man; we went at once to a Turkish bath, and enjoyed greatly its healthful luxury. We then called upon our host at his house close by. He was

lying sick in a bed spread out as usual upon the floor, in which he received his visitors, sitting up wrapped in a fur mantle, and smoking his pipe. The Catholic Armenians of Angora are the most bigoted in the East. They are chiefly the exiles of a religious persecution waged against them at the instigation of their brethren of the national Church, which they had abandoned for the purpose of embracing the Romish errors, being persuaded that they would thereby place themselves under the French protectorate. The Turks wanted nothing better than an opportunity to despoil the Nabobs of Candilli, Orta Keny, and Kuskunjuk of the enormous gains they had been making out of the simplicity of their Muslem masters. They exiled them to Angora and took possession of their real estates in Constantinople and its suburbs. It is the story of the dispute about the oyster which the judge devours, giving the shells to the disputants. But the priests have had the skill to turn the dispute to their own account. The Turks who were the real plunderers were deemed to have done only what was a matter of course, while the Armenians have been hated as the bigoted original cause of their losses. Every effort has been made to root them out of Angora, and with a great measure of success. The Armenians of this city have very generally gone over to the Romish Church, unable to bear the burden of the excessive *salians* (taxes) imposed upon them by the Turks at the instigation of their Catholic brethren. This effectual persecution has

nearly banished the old religion from Angora. Their churches are deserted, and, individually, they are made the objects of all kinds of vexation, so much so that an Armenian must now have independent means not to be starved out of his faith into Western orthodoxy. The Catholics inveigh against the Armenians for their former persecutions, and they are quite right; but they are doing even worse themselves. The example of the Armenians, however, is a fair instance of the natural effect of religious persecution; it always fails in the end of accomplishing its purposes, for it awakens a just indignation from which there is but one step to a spirit of revenge which brings punishment upon the original perpetrators. There is no doubt the day of reckoning will come with the Catholics as it has come with the Armenians, until both shall learn that the battle of truth can never be won by carnal weapons.

*Saturday, August 13th.* — Angora was inhabited during the latter part of the seventeenth and throughout the eighteenth century by a complete colony of English, French, and Dutch merchants, who carried on the trade in Angora goats'-hair or Teftik. The article was prepared in their warehouses and exported to Europe for manufacturing purposes. The wars brought about by the French Revolution, which put a stop to most mercantile transactions everywhere, produced the same effect here; but this most lucrative branch of commercial enterprise, after lying dormant for a long while, has, since the general peace, been again revived.

It is, however, now almost wholly in the hands of Greeks, who succeed in making very large profits; and by employing many hands in the business, as well as through their connexion with those who furnish the article, exert a very powerful influence over the affairs of this town and neighbourhood. Some of the houses originally occupied by the European merchants are still standing; they were very extensive, the lower portions consisting of magazines or vaulted rooms, where the *teftik* was prepared for exportation, with a separate entrance and courtyard for the use of the workmen. The premises inhabited by the family were entirely distinct, though built over the magazines. I visited such a house, which was once owned and occupied by one of my maternal ancestors. I roamed with intense interest through the now deserted halls and apartments, visited the parlour, stood before the fireplace, entered the private chamber, and looked around upon the spot where was planted the flower-garden, once, doubtless, the pet possession of the family, while my brain worked up a thousand images and fancies; I finally sat on the lofty terrace and refreshed my depressed spirit with the extensive prospect of city, plain, and hills, verdant with vineyards and orchards, and studded with country houses and villas. I searched in vain for some memento of the past, but only found in an inner chamber the date Jan. 19, 1779, and wrote under it my own name and the present date. This is the old Leidstar house, and my guide was the last

descendant of those European families, a gentleman by name Leonardi, who has practised medicine here for half a century. It is strange to find oneself thus suddenly ushered into the past; and this transition was the more vivid in my own case, as I well remembered the portrait of the old gentleman who once occupied this mansion, and could distinctly recall him to my mind in his Armenian costume, with a great Calpak upon his head. In like manner the European ladies, too, then wore the native costume, with the broad belt composed of two large jewelled clasps, fastening in front, and yellow slippers on their feet. But what a contrast with the present! The house is deserted and ruinous. It belongs to a bigoted Turk, Shasûr Oghloo Sali Effendi by name, who lived a while in it, but being surrounded by Christians, went away, saying "he could not bear their smell." It has been used only as a storehouse for grain since that time, and is fast falling to pieces. Turks eminently possess the genius of destruction. They envy their neighbour's property, and get possession of it by every means within their reach; but as soon as they have acquired the coveted object, they childishly neglect and throw it aside. The Santi house alone is still in a good state of preservation, and now belongs, I believe, to a Greek merchant engaged in the *teftik* trade.

I may here mention that though the European colony has long disappeared, and an old man of eighty is now its sole representative, yet I could perceive some signs

of Europeans having once resided there. As for instance, the wire-netting in the windows of many of the best Christian houses, a thing nowhere else to be seen in Turkey. There are also pigeon-houses protected in the same way, a very European object, which struck us as of evidently foreign origin. The little room on the top of many houses, called in Smyrna a kiosk, must have been introduced from that city, though all the Catholic Armenians have come from Constantinople.

There was a spot at Angora which I had a great desire to visit. It is a burying-ground lying by an old Armenian church and convent, built outside of the town upon the site of a temple of Jupiter.

We started on foot, and walked over the pavement of trachyte, and through narrow streets to the north-west gate. Saw on the way a number of remains of the ancient city, both lying by the roadside and built into the walls of the houses. The gate is of modern construction, but consists of pièces of marble taken from ancient buildings. The sides are made of fine cornices standing on end, one of which has the word ΚΑΙΣΑΡ cut in large characters. We left the main paved road, and followed a path leading us through gardens planted with vegetables. These are not divided by either walls or hedges, but only by well-trodden paths. The soil is alluvial and very rich, and nearly or quite the whole of the water of the stream we followed and crossed yesterday is used here

for irrigating purposes. After passing the gardens we came to an open space, upon which are built very extensive barracks, now unoccupied, and rapidly going to pieces. Went down through fields to a small stream which waters other gardens. A number of people were encamped here under tents, most of them engaged in washing *teftik*. At the end of the gardens stands the Armenian monastery, on a gentle eminence. The church occupies the south-east angle, and is a very old structure of an octagonal form, built chiefly of brick, and very much in need of repairs. The people of the monastery, which we entered by a double gate, were very civil, and showed us the interior of the church, whose walls are completely covered with blue porcelain. We saw many ancient marbles and pieces of columns lying about in the yards. The cemetery is outside the monastery, in the open field; in the church there are no graves. The monuments nearest the building have inscriptions in Armenian, Greek, and Greco-Turkish. There is then an empty space, and beyond it, in an irregular row, are the graves of the former European residents. They consist of slabs of marble, just as they were taken from the ruins of the heathen temple, with a Latin inscription in memory of the deceased. One of them is the cover of a fine marble sarcophagus. Another consists of a handsomely-carved cornice, and another still was the capital of a pillar. I saw a heathen altar among them, which once bore sacrifices to idols, but now serves to mark the

resting-place of a believer in the one only and True God, awaiting the morning of the resurrection. Another altar, with its Greco-Latin dedication, covers the remains of an Armenian or Greek, but bears no other than the ancient inscription. Some of my readers will, doubtless, be pleased to see the short list of the names of the European residents lying buried here, some of which point to families well known at the present time in the Levant and even in Europe. It is as follows :—

Joanna Dunscomb Addlevett, wife of an English merchant at Angora, died 1756, *æt.* 39.

Henry Dain, English merchant, died 1703, *æt.* 47.

Peter de Lignelle, Dutch merchant, died 1693.

Theodore Lecker, Dutch merchant, died 1679.

William Black, English merchant, died 1684.

Paul Malbranch Leidensiertus, Dutch merchant, died 1704, *æt.* 37.

Jane Maria Leidstar, wife of John Justinus L., died 1757, *æt.* 57.

Francis Roboli, French merchant, died 1757.

Joseph Guieu, French merchant, died 1779.

D. Lewis Rossi, French priest, died 1768.

Bartholomew Edward Glavanychiuss, French merchant, died 1737.

Anthony Joseph Santi, Venetian merchant, died 1792.

Leonard Polla Barbier, French merchant, died 1757.

Having accomplished our long-desired pilgrimage to this sacred spot, we returned to town by the highway. Found in many places the remains of an ancient paved road made by the Romans, and crossed the river over a bridge of hewn stone; the parapet is formed of blocks once united with iron or brass ties, which the barbarians have carried off. Received calls from several native Protestants, who endeavour to maintain their ground

despite the plots and adverse influence of the Catholic Armenians. These are, as usual, employing all the influence they possess with the authorities in order to prevent Protestantism from taking root in this city and province. The Governor had imposed exorbitant taxes upon these persecuted people, and one of them had lain for some time in prison on this account. But it was hoped that the authorities would finally be induced to pay attention to the public orders received from the capital, though it was suspected that they were annulled by secret instructions sent to the Pasha. We also met an old Constantinople friend, a Protestant Armenian gentleman, sent here as agent of an English merchant at the capital in connexion with the exportation of *teftik*. We were glad to learn that several English merchants of the capital were again taking a part in so profitable an enterprise; and there is no doubt that, if wisely prosecuted, it will be highly successful. It has been very sultry here ever since our arrival. To day the atmosphere was hazy and heavy; but at 3 P.M. there was a sudden change produced by a strong easterly wind, which made the thermometer go down 15 degrees. These sudden changes are said to be very common in Angora, and they make the climate a trying one for delicate constitutions. I may also mention here the result of my observations during our stay at this place. The barometer gives us 3334 feet as the elevation of Angora; this is somewhat lower than I had supposed; it is 1100 feet lower than Sivas

or Yozghat; and the region south of this city, in which the Angora goat principally ranges, is not generally higher, and often lower: Sivri Hissar is only 450 feet higher, and well protected on the north by high hills. It is also worthy of notice that the province of Karahissar, into which the goat has not penetrated, is higher than the province of Angora, while the region east of Angora, through which we had come, lies somewhat lower as far as Boghaz Keuy; but though we had there first seen the Angora goat, the specimens were rare; the owners highly valued them, and did their best to increase their number. I think, therefore, that a high elevation of the soil above the sea cannot exert any marked influence favourable to this animal. The only peculiar atmospheric phenomena which we noticed, and which may have a bearing upon this question, are electricity and sudden changes in the atmosphere. We were more than once struck with the amount of electricity in the air, and this, too, at a season of the year when we should not expect it. We could hear the sparks every time we combed our hair or passed our hands over the dogs' backs. The sudden changes in the temperature are generally acknowledged. How far these may affect the question of *teftik* I would not venture to say, except that they do have a powerful effect upon it, not sufficient perhaps to account for the existence of the breed, but probably enough to maintain it in certain conditions. It is worthy of notice that in particular districts the

Angora breed *excludes* all others. Let it also be remembered that while the Angora cat degenerates in other places, it does not here. I must say, however, that I did not see a single Angora cat during my stay there. But I saw several dogs whose white hair was long and silky, though they appeared otherwise of an ordinary and valueless breed.

*Sunday, Aug. 14th.*—The few Protestants of Angora are accustomed to meet this day in the house of a helper sent from the Mission Station at Broosa, who conducts services in the Turkish language. He is a plain man, who has learnt all he knows from the study of the Bible and of the few books published by the Mission, having had no regular school education. Such men accomplish a valuable pioneer work, though there is some difficulty afterwards in replacing them by a higher order of labourers, which is sure to be soon called for by the people. Having given up their trade and business connexions, it is hard for them to obtain a maintenance when they cease to draw a salary. Some of our sorest difficulties have arisen from the position into which these men have thus been thrown, with perhaps a large family to support. The natives have deeply sympathised with this class of persons; they are considered to bear the relation of servant to master toward the missionaries who have employed them, and that relation has a patriarchal character in the East which is unknown in the West. A native always considers himself the servant of a

man "whose bread he has eaten." We here see men who have risen to wealth assume the position of servants whenever they enter the house of their former master subsequently reduced to poverty. And so a servant is never dismissed except for bad conduct; it is thought a virtue to cling to a master who can no longer pay his servant's wages. It is true, wages play a small part in the relation of master and servant; they generally consist of food and occasional presents, and the servant has the power to leave without cause, more than the master to dismiss him if without blame. I believe we should study more carefully the minds with which we have to do, and not endeavour to force upon them a cut-and-dried system which our theological studies and our Occidental habits have led us to regard as the best for man in the abstract, but which, after being settled upon these Orientals by dint of hard pounding, will fall to pieces as soon as we get out of the way. The institutions we introduce should, like those of the Apostles, find so perfect a response in the hearts and wants of men, that they will be sustained by their own inherent vitality after we are dead and all pecuniary aid is withdrawn from abroad.

But to return to the Protestants of Angora. They are simple-minded people, who bear persecution with considerable endurance, and I believe there is a great work to be done in that city; the very opposition of the enemy is an excellent sign for the future. We had a religious service at 10 A.M., and twenty persons were

present. I addressed them in Turkish, and baptized two little children. I took the opportunity to give them an account of the condition of their brethren in such parts of the country as I had visited, a subject in which they naturally take a great interest. I shall mention here a little incident illustrating some of the annoyances to which the traveller in these lands must prepare himself to submit. The helper thought we should probably have a larger congregation than usual, as was indeed the case. He occupies the upper rooms of his house during the summer, on account of their greater coolness. These being small, the service was held in one of the lower rooms, which was large, but had been little used since the warm weather set in. The heat seemed greatly to have increased the numbers of certain well-known lodgers, not to be named in good society, but called by the natives wood-bugs, and by a friend of mine B flats. Their appetite moreover had become vastly developed in the absence of their customary prey. Their head-quarters seemed to be about the table that had been fitted up as a pulpit, and a mattress laid upon some chests for the special comfort and honour of the guests from abroad. As I proceeded in my address, I noticed one and another of my fellow-travellers fidgeting and changing his place, and began to experience some strange sensations about the only unprotected points, the neck and wrists. Still I persevered bravely, until, the very instant I closed, several of my hearers rushed upon me and brushed off from

my clothes whole handfuls of most lively and slippery enemies. Fortunately for me the services were sufficiently short to prevent any serious consequences. This is not worse, however, than the experience of one of my brethren at Marsovan, who could never preach without first drawing a magic circle of insect powder around him as he stood up in the pulpit, to keep off the fleas. He, however, poor man, was peculiarly sensitive on that subject, so that, when travelling, at the stopping place for the night his good wife used to put him in a bag and tie it around his neck.

An incident occurred in connection with one of the Angora Protestants, which, though belonging to a later date, may as well be mentioned here. There is in this place a converted Turk who became acquainted with Evangelical doctrine in Kharpoot, and was sent here in exile two and a half years ago. He was first imprisoned, but as he was a very quiet and inoffensive man, all fear of him was soon allayed, and he was allowed to go free, though bound not to leave the city. He lives in great poverty, endeavouring to support his absent family by the labour of his hands, which is often prevented by his enemies. I gave him some medicine for an eruption of long standing which he had on his hands, and two months after I received a letter from the helper in Angora stating that he was quite recovered, and that he, himself, was suffering from a similar malady, and desired some of the same medicine. I forwarded some of the same homœopathic pills, and

after a while another letter reached me from the helper, saying he had used one half of the medicine and been cured; the other half he had given to a friend of his, on condition that, in case he received benefit from it, he was to present a copy of the Scriptures to some poor man. The present had been given, and as another person still desired some of the same medicine, I forwarded a supply, proposing to the helper that whoever was cured of his disease should follow the same good example, and present a similar thank-offering to the Lord. The matter stood thus when I last heard from them.

*Monday, August 15th.*—Visited the castle which occupies the top of the hill. There are three walls on all sides except on the north, where the place is protected by an inaccessible precipice. The many towers which support the walls are generally square, but those of the second or middle wall are of an unusual shape, projecting, in form like the bows of a ship. The third or outer enclosure is the most dilapidated of all, and appears the oldest; the ancient work is built of large blocks beneath, and brickwork above; some parts have evidently been patched up. The central towers by the west gate are sound. On the top of the hill is a small castle where powder is now kept. It is said there is also old armour preserved there. The highest part of the hill appears to be occupied only by Turks, and was silent and solitary. We saw several mosques made of fragments taken from ancient buildings. There are many old stones, several altars, some sculp-

tures, and inscriptions, in the walls of the fortifications and the houses; I copied a lion resting his paw upon the head of a sheep, which the reader may compare with the Euyuk Lion. It stands near the brow of the

Ancient Carved Lion at Angora.

precipice on the north. The view from this spot, the highest on the hill, is extensive and fine. A great plain spreads out to the horizon on the south and west. On the north and east the ground is hilly and covered with vineyards and country-houses, to which a large portion of the population of the city has now removed. Right under our feet passes the stream by the side of which we travelled the other day. Its narrow valley is fertile in the extreme, and we can distinguish the people walking or riding at the foot of the precipitous ledge.

Visited the Temple of Augustus near the southwestern extremity of the town, celebrated on account of its inscription containing the list of the buildings erected by the Emperor. It is very simple in plan, as are most of these buildings; it is made of the finest marble, with few but tasteful and highly finished ornaments. The yellow on the outside of the marble is not an effect of the atmosphere; it seems to me, as in the case of the same tint on the Parthenon at Athens, to indicate gilding. We also visited a solitary column

Ancient Column at Angora.

on the edge of the town in the same direction. It is 50 feet high, and of white marble. Most of the column

is made of thin circular pieces of marble set upon each other. Much of the capital has fallen, and the rest will soon follow. The storks have made their nest upon the summit. This column was probably the centre of the ancient market-place; and there are mounds in the immediate vicinity which indicate that large buildings once existed here.

## CHAPTER XXIII.

Continuation of journey—Villages of Balū Kooyoomjoo and Chiflik—Petrified shells—Turkmen summer-houses—Sakaria river—Villages of Orta Keny and Hortoo—Lazy muleteers—Black sienite—Village of Sivri Hissar—Dyeing of Skins—Trials of the Christian population—Physical features—Village of Balahissar—Ruins of ancient buildings—The Angora goat—Ruins of castle and theatre—Sculptures—Night-travelling—Tents of nomad Turkmen—Turkmen village of Baghlūja.

**TUESDAY, Aug. 16th.**—Our lame horse is unable to go on. We have tried to sell him, but have only been offered the worth of his skin. *Menzil* (post) horses are exorbitantly high. Having resolved to purchase an additional horse, we had a good opportunity of seeing the quality of Angora horses which generally enjoy a high reputation. That can be true, however, only of the Turkmen breed which is sometimes brought into town. What were shown us were a mongrel species, remarkable only for their extreme corpulence; the people about us seemed to think this a true measure of a horse's worth, and quite despised our thin steeds, though inured to hardship by a long journey. We finally purchased a small Turkmen horse, for which we were laughed at by the crowd of lookers

on, but which proved highly serviceable, and soon won the affection of his young rider.

*Wednesday, August 17th.*—We did not manage to get away to-day until 10.40, but succeeded this time in obtaining a guide or *zabtieh* who was to show us the way as far as Sivri Hissar. Our direction was nearly S.W., and the weather very cool. Our course to-day was entirely over an undulating plain which appears to extend out of view from Angora in a south and west direction. Its soil is generally rich, and nearly the whole of it appears to be occasionally sown with grain. About 4 the hills on both sides of us grew taller, and at 4.30 we reached Balù Kooyoomjoo, a village built in a kind of cove, with a tall palisade of trachyte on the south, of a semi-circular form, out of which flows an abundant stream that waters several gardens, and willow-trees. We saw many Angora goats about the village mixed with sheep. Our landlord seems to be very well off; he is a shepherd himself, and owns 300 goats; he says that the goats give better and more wool when they are not fed solely upon grass, but have also the leaves of such trees as the scrub-oak and the willow. He told us that some yellowish goats we saw were brought from Koniah, the ancient Iconium, where they have a goat similar to the Angora or *Teftik*, but inferior in value. This importation occurred after a severe winter, which, three or four years ago, killed many of their own goats, for the true Angora breed is delicate, and cannot stand very

severe weather. The Koniah breed was thus introduced, and was crossed with the remaining pure *Teftik* males. By persevering in this process all traces of the foreign breed disappeared in two or three generations. He assured us that this goat endures the cold, but is apt to suffer from wet weather, and must then be kept under shelter. I have noticed, thus far, that this animal has the habits of the sheep far more than those of the ordinary goat. Indeed the region we are passing through would be very poorly adapted to the latter, which is accustomed to climb the hills, and feed on the leaves of bushes and young trees. The Angora goat, on the contrary, feeds in the plain, and on the slight hillocks which are somewhat rocky, and offer them a scanty herbage; hence we generally see them in the company of sheep, and indeed they cannot be told apart at a short distance, owing to the similarity of their form. This is especially the case just now, when, the shearing season being but recently past, their hair is still short. They are most readily distinguished by their horns, which are bent backwards, while those of the sheep are outward and forward. The high and cold wind has made us all unwell to-day. I have an overpowering head-ache for my share, and what seems like a touch of the intermittent fever. Balù Kooyoomjoo is six hours from Angora, and there are said to be interesting ruins in the neighbourhood. But I was too unwell to seek them out.

*Thursday, August 18th.*—A bad night, with hard cough and fever. Head better this morning. At 6 A.M. thermometer stood at 63°. Leaving at 7.30, we reached Chiflik at 11.45. This, as its name imports, is a farm belonging to a Turk, and contains a large dilapidated house, as well as a large stable full of horses, some of them very fine; there are also a few miserable huts and a neglected garden, all built upon the slope of a slightly rising ground. The master of the place was there with a friend, and they spent their whole time while we remained in drinking Raki. Everything about the premises showed the consequences.

We left Chiflik and its drunken masters at 2.30. They seemed to be amazed that we, whom they called English, should refuse to taste their beloved Raki, and had no brandy to offer them. We picked up on our road several loose bivalves, which had preserved their form, while the rock that held them had decomposed. There were pieces of trachyte among them, probably brought there from some ruin in the vicinity, and too hard to change into soil. Ascended the hill, and from its summit had our first distant view of the sharp rocks of Sivri Hissar, behind which lies the town of that name. As we came down the hill we picked up more petrified shells, and soon came upon the ledge which contained them. It appears to be a sandstone which crumbles readily and covers the surface of the ground with its débris. Came upon a dyke of trachyte which has cut through the sandstone, and, after it, found

several beds of white marl. We still continued to descend until we reached an extensive plain upon which we noticed a line of mounds running nearly S.W. and N.E.; six of the largest certainly lie in this line, though some of the smaller ones appear to occupy a more irregular position. The ground soon became spungy though dry, indicating that it is swampy during a great portion of the year. We now had before us the *yaila* or Turkmen summer-houses of Euyuk. They consist of houses open on one side, and containing a single room; and it was with difficulty we could find an empty one, which we occupied. It was separated from the rest by a small stream, with a wooden bridge consisting of a single plank. The soil was so clayey that we found it impossible to make the horses ford the little stream, and our effects were carried over the bridge by the men on their backs. We closed up the open side of our dwelling with a carpet lent us by the Turkmen, in order to keep off the innumerable mosquitoes and the sharp damp night-air. This place is occupied only in summer by these people, whose habits are somewhat nomadic. Their chief occupation is the rearing and tending of cattle. They have, however, several summer-gardens here, or rather *bostans* (melon-fields). They occupy a great portion of the region from Angora to the ridge of mountains on the north of which lies Baghluja, and many of them keep *Teftik* goats, though I believe that these generally remain in their villages, owing to the little

power of endurance possessed by that animal. I am not quite certain of the fact, but I noticed few of these goats at the summer camping ground as we passed along; the greatest number were in the permanently occupied villages. The plain is drained by the Sakaria River, and is swampy even now. In winter it must be impassable. The several little streams meandering through this district, some of them very full, and one, 200 yards from our lodgings, turning a mill, all flow into the Sakaria.

*Friday, August 19th.*—An observation at this place shows that we have been rapidly descending since yesterday noon; for we are 700 feet below the Chiflik, and 1000 feet lower than Angora. We started this morning at 7, the air being quite sharp and chilly. Our lame horse finds it difficult to keep up, though he has nothing on his back. The horses passed the night out of doors, there being no stables; but the Turkmens kindly tied carpets around them to keep them warm; Master Colt cut a great figure with his night-gown on. We very soon reached the Sakaria River, which here flows through a low, marshy plain; its banks are covered with reeds and coarse tall grass; its current is very rapid, and the water whitish with the clay it takes up as it moves on. It winds about a great deal, but follows a general direction from the S.S.W. The soil over which it passes is so clayey, that it must be quite impossible to ford it, though the water itself is not too deep at this season. We rode along the right bank,

going up the stream. This part of the plain shows no sign of cultivation; indeed, it is not susceptible of it, as appears from the signs of inundation we see around us. The valley of the Sakaria here appears to have an average width of about three miles. There was, doubtless, an inland lake, which once covered the whole great plain, through which this valley is now sunk like a ditch or trench. At 8 we reached the wooden bridge over the Sakaria. There is a small guard-house on the right bank. I took an observation, in order to discover the height of the river at this place, and found it 2387 feet. We had come up 67 feet from Euyuk, our last night's lodgings, a distance of about four miles. While I took my observation by the guard-house, the rest of the party crossed the bridge and found themselves among loose camels, to which some of the horses were still unaccustomed; and thereupon followed sundry interesting feats of horsemanship, which, I fear, the Turkmens did not fail to see and duly admire. It is singular, that the horse has in every age, had an instinctive dread of the camel, which habit alone can subdue.

After going up a considerable hill, we descended into a valley, which is watered by a small but strong stream, running north toward the Sakaria. We could see the beds of gypsum on the sides of the hills, but there are also many pieces of trachyte lying about. Whole hills seem to be formed of disintegrated gypsum, but the strata clearly distinguishable near the steep

summits have an almost horizontal position. Went across the valley and up the hill on the right to the village of Orta Keuy, which we reached at 11.45. A stream passes through it, and we went into a garden and took possession of a wooden platform, built over the water in the thick shade of the trees. This platform has a roof of branches resting upon the surrounding trees, and was altogether a most agreeable spot. Water appears very abundant here, but it is clayey, and we have to let it settle before drinking it. We found the people sociable, polite, and hospitable. Their houses are solidly built of stone, with flat roofs.

Stone Houses with roofing of Hay.

They pile hay upon these, by first setting a wooden frame upon the centre of the roof, which is made by four upright poles united

with horizontal sticks. When the hay has been piled upon the frame, the whole thing is easily mistaken at a distance for a dome.

We have been rapidly rising since we left the banks of the Sakaria; for this village is 500 feet higher than the river. Started at 4 o'clock, and came right down into the valley again; it is well cultivated, and the banks of the little river are adorned with trees. The gypsum rock on the hill-side was trying to the eyes, but we found the green glasses surrounded with wire, which we had purchased in Angora, extremely

serviceable. Some of us had blue ones; they offered but little relief to the eye: the green were invaluable, no traveller in Asia Minor should be without them in summer; many of the natives have adopted them. But coloured glasses without wire netting are of very little use.

We entered at 5.30 the village of Horteo, built on the slope of the hill, and commanding a fine prospect of the green valley beneath it; were kindly received and hospitably entertained by a well-to-do farmer, a Turk, whose house formed the lower corner of the village. We had a comfortable piazza for our quarters, and an enclosed court before us, surrounded by stables, where our horses were put up.

*Saturday, August 20th.*—We were on the way at 6.30. Found that our two muleteers whom we engaged in Yozghat had given the horses no water either last evening or this morning. Their conduct has been very unsatisfactory for some time past, they being excessively lazy, neglecting their work, and impressing the villagers to perform what they are paid to do themselves. Moreover, it had been agreed with them at starting that they should ride only one-half of the time. But they played us the trick of falling back, and then both riding constantly. We had resolved to dismiss them at the first good opportunity, even before we had learnt their cruelty to our poor horses in making them go without water. And now when we came to the stream they drove the horses through without allowing them to

drink, though the poor creatures tried hard to do so. Their object was to push so far ahead of the party that we could not see they were riding. The *zabtieh* turned traitor on this occasion; he informed us of their conduct at the brook, and, when charged with their delinquency, they had nothing to say. The first consequence was a whipping on the spot; next, the horses were turned back and allowed to drink their fill. The men were then made to walk, and the animals were led by ourselves, not to allow them to lag behind. At 8-30 came in full view of the curious scalloped hills, behind and at the foot of which lies the city of Sivri Hissar. Passed on the left or east side of these hills, which stand isolated. Our road led us among abandoned vineyards and dilapidated country houses. This remarkable mountain is composed of black granite or sienite, extremely hard, being decomposed very slowly, and producing a sandy and almost unproductive soil. The vineyards planted upon it seemed puny and withered, and the rocky portions bare and black; this was especially the case in the more elevated and steeper portions. As we passed over the rising ground and turned north, the town came at once into view. It lies at the bottom of the highest hill, and is well protected by the range on all sides but the west and south. The rugged and black mountain behind it forms a striking contrast to the white houses of the town, whose flat roofs appear to lie in regular horizontal layers. From this point the stratification of the sienite comes fully

into view ; it is not far from the perpendicular, certainly not more than  $45^{\circ}$ , the dip being toward the west, and the hard strata forming ridges running nearly north and south and making rugged crests upon the summits. There appear, however, to be large masses near the tops, which bear no signs of stratification. These crags are so peculiar and marked that they are easily recognised at a great distance ; and I am told they can in clear weather be distinguished from Angora itself. We entered Sivri Hissar at 9.30. It is a smaller place than Yozghat, and in front of it lie very extensive burying grounds, covered with upright stones. You cannot approach the town without perceiving that its principal occupation consists in the dyeing of skins. The odours which fill the air, and the coloured streams that flow through the streets, as well as the appearance of the shops—everything in the lower part of the city reveals the employment of the inhabitants. We passed before the door of the Governor's house and took a messenger, who conducted us to the dwelling of a member of the Mejlis, where we were furnished with commodious, but not over cleanly, quarters. There are portions of columns, and other ancient remains, lying about the town. We took a ramble through the streets, but found nothing of any interest. The domes of the mosques are tall and pointed. All the women we met, even small girls, wore a square carved ornament of silver upon the tops of their heads ; it appears in all respects like a box, and is fastened to the head-dress. Strange

fashion, indeed, and as arbitrary as any I have ever seen, Called on the Mudir, a very pleasant and well-informed, and withal a quizzical gentleman, from Constantinople, and met there a self-conceited young Cadi, who was brought up at Bebek on the Bosphorus. We saw some fine horses in the stable of the Turkmen breed. I bought here a very fine skin of the *Teftik* goat, and paid sixteen shillings for it. We had purchased some smaller ones at Angora, for which we had paid from two to three pounds, but they were both dyed and tanned.

I received a call from an Armenian who had heard the Gospel preached in Angora by a native, and had received it with joy. He has suffered much persecution in consequence. He says there are twenty-five people here who make the same profession. Though possessing no wealth or influence wherewith to resist the assaults of their former co-religionists, they are well thought of by the authorities, and protected from all harm. The Armenian and Greek population of this region is very small. They have been either destroyed by the oppression of the conquering race, or have taken refuge nearer the sea-coast, where the watchful care of the European consular authorities afford them some protection against their Muslem masters. There was a large Christian population between Angora and Afion Karahissar at the time of the Crusades, though the Saracenic and Persian armies had already slaughtered many of them. The Turkmen who followed were far more numerous; and though many of them settled

down in the towns and villages, and assumed the name of Turks, there are yet great numbers who have preserved the nomadic habits of their ancestors, and go by the name of Turkmens. It is said that there is a small fort of great strength on the highest point of the hill of Sivri Hissar, and in front of it a rock, whose smooth surface is broad enough for a thousand horsemen to manœuvre upon it.

The barometer shows the elevation of Sivri Hissar to be 3778 feet. This is 450 feet higher than Angora. I cannot, however, consider the climate as likely to be more severe, on account of the complete shelter afforded the town toward the north and east by its great black hill. The ground generally slopes down from it. The country to the north and south of Sivri Hissar may be described as a vast plain, without any mountains. But this plain has been cut up by watercourses and slight depressions of the soil, produced by trachytic dykes breaking through rocks of comparatively modern origin. I suppose it must belong to the cretaceous period of Geology, though it is as yet difficult to fix its exact age. From Angora there is a general depression, extending as far as Euyuk-Yaila, amounting to about 800 feet. Here we meet the bed of the Sakaria River. From Euyuk the plain rises, probably under the influence of the sienite of Sivri Hissar, until the upheaval amounts to 1400 feet, and 150 feet above the plain. The latter then assumes a general elevation of about 3200 feet above the sea, until it ends at

the chain of mountains south of it, in the direction of Baghlùja and Bayat. The upper town of Angora is about 200 feet above this plain, leaving 3200 for the plain itself. We have seen that, after making allowance for unimportant depressions, the general level as far as Sivri Hissar is the same. Balahissar has a level of 3200 feet; and Baghlùja stands about 400 feet above the plain, making the latter when it reaches the mountains again 3200 feet. How far this formation extends east and west I have no means of ascertaining; but I point out the fact, not only on account of its geological interest—indicating an extensive inland sea to have once existed from Angora to Baghlùja—but because it is well known that the region I have described is the almost exclusive *habitat* of the *Teftik* or Angora goat. It may be found that this has a good deal to do with the successful rearing of the animal; and, at any rate, in the present uncertainty of the question, I feel it my duty to point out every circumstance which seems to have a bearing upon it, however remote that bearing may finally prove to be.

We were again in our saddles at 3:30 P.M. From the higher points of the plain it appears level throughout in a southerly direction as far as some blue mountains in the distance. I can have little doubt that it belongs to a single contemporaneous formation. If we examine, however, this apparent level, we perceive that the surface is often cut by watercourses, forming valleys of greater or less width, and even lower plains

of considerable size. The denudation is sometimes so great, that isolated hillocks alone remain, whose summits indicate the original level of the whole country. Everything here is white with the friable limestone which composes the formation, and is now covered with a scanty growth of grasses, and short plants dried up by the summer's sun. Our way was first strewed with débris from the sienite hills. Passing over an undulating country, we came down into a narrow valley, and descended by a steep road flanked by limestone cliffs into the village of Balahissar. This is a small cluster of houses built on both sides of a broad street, which becomes a torrent in rainy weather. Ruins of columns and hewn marbles lie about us in every direction, and we can easily trace the foundations of ancient temples and other buildings long ago levelled with the ground. Many of these remains now mark the resting-place of the Muslem vandals who lie in extensive cemeteries on the hill-side. The Mudir of Sivri Hissar had given us a guide, who carried a long spear *à l'Arabe*, and was fond of showing his horsemanship by setting his steed to the gallop and brandishing his weapon. This spear is made of a strong but light reed brought from Damascus, resembling bamboo, but of a darker colour. This man led us to the house of the Kiahaya of the village, which consists of an enclosed court and large room, open toward the east upon the court. On both sides of the gate are blocks of antique marble, used as

scats. The main street of the village passes in front of this door.

The sole occupation of the people here is tending the Angora goat, with a few sheep mixed with them. They are considered rich. Their houses consist of two or three rooms with a flat roof, which are occupied in winter, and an open room like ours, for summer use. The goats have large enclosures built for them, with a stone wall, some 10 feet in height, and extensive and good shelter, which can be kept warm in winter, cool in summer, and dry at all times. At this season of the year they are fed chiefly at home. There is an excellent fountain at the east end of the village, so arranged that the water runs through 90 yards of troughs laid in a continuous row by the wall, on the side of the main street. These troughs are principally of wood, but several of them are ancient pillars hollowed out for the purpose. In this way when a flock of goats comes up to drink, which they do three times a day, every one of them has immediate access to the water; and this can be better done because the goat does not soil the water from which he drinks. The gate of our house being near the fountain, every goat in the village passed before us six times a day. The last time was late in the afternoon, and then they went out to feed upon the neighbouring slopes. I understood that they spent the night out and remained at home during the day, probably on account of the heat. We had thus a

good opportunity of watching the animal. I believe that my sketch of it gives a correct idea. It must be admitted, however, that at this season the hair is short, so that we cannot see the length it attains. But this disadvantage is compensated by our ability the better

Teftik or Angora Goat with Hair shorn.

to distinguish the form of the animal. I confess that I began my study of this creature with a previous idea that it was a near approach to the wild goat, of which the domestic goat was a degenerated form. But I immediately lost this conceit on seeing the *Teftik* at home. His general form tends to that of the sheep. I should say that he is the farthest removed from the wild goat of any species I know, both as to form, intelligence, and hair. He is the longest haired goat I know; the hair of the wild goat is very short.

The *Teftik* is white, the other is reddish brown. The form of the latter shows a strength of sinew, an elasticity of muscle, a quickness of eye, and elevation of head which are more or less represented in the whole tribe of goats. But the *Teftik* is not made for climbing any more than sheep, and like them he keeps his head low, follows a lead, and makes no attempt to feed by himself. We certainly saw some splendid specimens, especially of the males; larger too than I had thought it possible, from what I had hitherto seen. Their bodies are compact and broad; the male has long horns which are twisted backwards, while the female, every way a smaller animal, has also proportionately smaller horns, perfectly straight at first and then bending backwards. I noticed one male whose horns were the exact counterpart of those of a wild goat, only smaller; another had them bending round behind his ears; while the horns of a third turned gracefully forward and presented two sharp points in front of his forehead.

It is curious that a place where perhaps the most extensive ruins can be found in all Asia Minor, should now be one of the most important spots where the great staple of the province, the *teftik*, is produced. But so it is. Balabissar is old Pessinus, well known more than 1000 years ago for its beautiful marble temples and other public buildings. The ruins are comparatively in a virgin state. A little digging has taken place just outside the village on the south,

where fine marble slabs have been taken up to be used for building purposes at Sivri Hissar. There cannot be any doubt, however, that a rich mine of fine remains lies hidden under the ground; but the difficulties of transportation are such that no one is likely to disturb them for centuries to come.

In our ramble about the village in search of antiquities we first went to the north-west, passed through the cemetery which lies on the slope of the hill, and ascended to the castle. It crowns the top of a hill which is on a level with the plain above; the castle hill is, therefore, somewhat difficult of access on all sides but this, where the exposed part is small, and seems to have been fortified by a strong wall. The gate appears to have been near the eastern end of this wall, and close to the road which goes down into the village. We could easily trace the whole enclosure around the citadel. There is a good general view of the ruins from this place. We now descended across the valley and found at the north-east end of the village the foundations of a temple standing considerably above the ground. We proceeded thence to a ravine which runs upward and eastward from this point, and was once a side street running to the principal thoroughfare, there we found the remains of a theatre. The portico must have been a handsome structure, judging from the delicate carvings still remaining. A good deal of marble seemed to have lately been dug up and carried off from this place. The seats

can be seen over a good part of the theatre, many of them are lying loose above the ground, and some are still in full sight in their places. On our return by

Ruins of ancient Theatre at Pessinus.

another road we came upon the remains of another temple still in the main valley. We also took a ramble on the south side of the village, and found the bottom of the valley and all the eastern slope covered with the marble remains of ancient buildings. In several places old foundations had been brought to view by recent excavations. The sculptures were generally in very fine taste and finish. One building stood on a slight eminence nearest the village. It was very nearly of a

square form, and several stones had a representation of boys supporting garlands made of bunches of grapes. It was, perhaps, a temple dedicated to Bacchus, and cornices and fluted and plain pillars lie all about it. Every slight rise in the soil seems indeed to have been taken advantage of in order to erect upon it some

Ancient Carving at Pessinus.

public building. The ground covered by the principal ruins, beginning at the foot of the fortress, is about a mile in length; but ruins of a more ordinary description extend a considerable distance down the valley. The stone used is exclusively marble, which had to be brought from a great distance; but there are also vast quantities of bricks, evidently ancient, lying about in every direction; most of them are red, but some black. The village which now occupies the site of this once rich and proud city is partially constructed from its remains, but chiefly of common stone cemented

with mud. Here is seen the difference between the ancient Asia Minor of the Romans and the modern Anadoloo of the Turks, whose once destructive and now crumbling empire is supported and propped up only by civilized and Christian Europe. It certainly looks very much as though neither civilization nor Christianity had yet found its way into the politics of Europe.

*Sunday, August 21st.*—We were isolated to-day among this Turkish population with whom we have but little in common in respect to our religious views. Our landlord is hospitable, kind, and talkative; but he appears not to trouble his mind with religious speculations. We spent the day quietly under our roof with a cool westerly breeze, reading or sitting under the trees on the other side of the way. My fever has nearly left me. But one of our number has been very poorly for the last two days, occasioning no little concern. He has fever, which may turn to either intermittent or gastric, and it is hard to say which of the two evils would be the least. One thing is clear; travelling in the hot sun is beginning to tell upon us. We must patronise the night more than we have done, now that the moon has begun to favour us with her light.

As E— was much better at night I am inclined to think he either had a touch of intermittent fever or was over tired. We shall start in the middle of the night, and trust we may fare better hereafter by less

exposure to the burning sun. Our *zabtieh* has gone back to Sivri Hissar, but we have found a man who will keep us company as far as Dervend, which is four hours hence, and six from Sivri Hissar.

*Monday, August 22nd.*—Started at 1:30 A.M. We at first greatly enjoyed the coolness of the atmosphere; and the moon shone bright over head. But when it set the air became so cold that we were glad to dismount and walk in order to keep warm. This being also our first trial of travelling by night, it was hard to keep awake; the regular step of the horses acted like the swinging of a cradle, and several of us nearly fell off the saddle. We tried whistling, singing in chorus, smoking, eating, all in vain, and had finally to resort to walking—the increasing chilliness of the atmosphere especially favouring this expedient. Our road was rather stony, generally passing along the ravines or valleys that are sunk in the plain at various depths. I could see in the moonlight that some of the rock we passed over was gypsum. At 3:30 we went by the village of Chiflik, and found the dogs wide awake and ready to salute us. At 5:30 we reached the Sakaria River flowing from right to left through an alluvial valley. This is called Dervend, and the river is here spanned by two bridges. Crossed over to the small village of Aktash, whose gardens and trees lie between it and the river. Stopped at an isolated two-story shed, the house of a Government official whose occupants were just getting out of bed, and where coffee was given us by a man

who spoke a little English and French and pretended he was an Englishman; he had been a good deal on board men-of-war in the vicinity of the Dardanelles. Took an observation here and found the elevation of the Sakaria River to be 2824 feet, or about 440 feet higher than where we had crossed it before, a little above Euyuk. Passed a Turkmen encampment where the tents seemed to us better calculated for comfort than anything we had yet seen. They were rounded at the top, and seemed to be made of pieces of felt spread over a light frame of bent rods. The covering of the tent on the side toward the wind, and from the sun, was raised, and the opening was occupied by lattice such as is used

Tent of nomad Turkmen.

for the windows of Turkish harems. The lowest portion of this aperture, however, is closed by a board or cloth to the height of

a couple of feet, preventing the reflection of the sun's rays from the heated ground entering into the tent. Having wandered off the road we passed by some threshing-floors, where we were directed to the first village on the mountain. And at 11.15 we reached Baghlûja, a Turkmen village considerably to the right of the main road, built on the slope of the mountains at the end of the plain. It is said our route will now pass over a mountain region, portions of which are wooded. The very extremity of the plain, at the foot of the mountain, is

here occupied by the gardens of Baghlûja, and watered from springs coming down the hills. Here ends also the range of the *Teflik* goat, for as soon as we step upon this sort of island, or continent, from the billowy plain we have traversed, this animal is no more to be found than fish upon the land; goats are plentiful, but they are of the ordinary breed, with the usual strongly marked forms of the animal, its varied colours, and its active habits, climbing upon the rocks and browsing on the bushes. The rock, of course, also changes its character, and we now find ourselves among primary limestones, conglomerates, and hard shales.

## CHAPTER XXIV.

The inhabitants of Baghlùja — Ancient sculptures — Bad conduct of the muleteers — Wandering without a guide — Wildness of the country — Volcanic region — Village of Scidiler — Natural tower — Town of Eski Karahissar — Wells — Arrival at Afion Karahissar — Position of the town — More trouble with servants — Horse-hiring — A reforming Caimacam — Cultivation of the poppy — The Whirling Dervishes — Ancient monuments and sculptures — Turkish village of Balmamood — The broad-tailed sheep — Four-horned sheep.

**B**AGHLÛJA, *August 22nd.*—As soon as one leaves the beaten track of Government messengers or *zabtiehs*, it is impossible to ascertain distances; for people keep no watches, and the only measure of distance known is the time it takes to pass from one place to another, a measure extremely unsatisfactory at the best, for no two men or animals move with precisely the same rapidity. But on the travelled roads the Government officials are obliged to fix the nominal distances in order to determine what is to be paid to the *menzil* (post). So now that we are somewhat out of the post road, it is impossible to ascertain our exact position. Some say we are just half way between

Sivri Hissar and Afion Karahissar; and others that we are ten hours from the former and fourteen from the latter, which seems to me more probable. I ascertained our elevation at the upper part of this village to be 3594 feet above the sea, which shows that this portion of the plain has continued of about the same height as the parts farther north, *i.e.* about 3200 feet.

Baghlùja is a Turkmen village, and we were glad to find ourselves thrown familiarly among these people, in order to study their manners. They were kind and hospitable, and offered us the best they had. The women, whether married or not, do not cover their faces; they wear, however, a handkerchief upon their heads, which hangs gracefully behind and on the shoulders. They have a head-dress of great size, and wear pieces of money hanging on both sides of the face, as our ladies wear their hair. They also have ear-rings made of long strings of coins, both gold and silver, which come down upon the shoulders. They wear bracelets around their wrists, and rings on their ankles; but I was much surprised to see our host treat his wife with familiarity and affection in the presence of strangers, and show fondness for her society and conversation. This is truly very *unoriental*. These people appear to be well off, and their houses are built so as to enable them to withstand pretty severe cold weather. There were many mutilated sculptures, and some inscriptions lying about or in-

serted in the walls, of which I copied the most

Mutilated Sculpture at Baghlikja.

interesting. There must have been an ancient town here.

*Tuesday, August 23rd.*  
—We slept all the afternoon, as well as the flies would allow, so that we were better prepared for a night journey. Having no guide that could be relied upon, we got all the information we could from the villagers about the road, and were in the saddle at 12-15. Although I generally consider personal narrative a great bore, yet there

are luckless travellers, like ourselves, who do not journey as “Milordos,” scattering guineas as they go, and surrounded by cavasses, guides, cooks, tent-pitchers, and the other etceteras; but as “*particuliers*” in more than one sense, who hold to the old proverb that a man is his own best servant. For the benefit of such, I shall continue to relate the misdeeds of our muleteers and men of all work, the highly-recommended Suleiman and Mahmood, against whose possible faults we thought we had taken every precaution,

when we obtained security for their good conduct. We often rued the day we had taken these men with us ; and I am sure we should have fared far better, even as regarded cost, had we made any, even the most liberal arrangement with our well-known and trustworthy Tocat people to go on with us to our journey's end. These lazy followers had, again, taken advantage of us the preceding day, and had both ridden on the top of the loads, so that the poor animals were completely worn out. Indeed, one of them, a young but very promising creature, gave signs of breaking down ; we therefore put most of our loads upon the other horse, and allowed the men to ride the younger one by turns. This would not suit "their honours'" humour, and they both refused to ride, saying they would walk. So we let them try it, purposing to stop somewhere and wait for them. At first our road led us over a level surface, with cultivated fields on either side ; and the moon gave so much light that we felt we could not lose our way again. Here and there the people were lying by their heaps of grain, or under a booth made of branches, the dogs coming out to bark at us as we passed. We asked the aroused sleepers whether we were going right, and they always answered in the affirmative. We pushed on with the same precautions for about two hours, when we came to a deserted village in a hollow ; the people had removed their quarters for the summer to the top of a hill on the right, as we could discover by the occasional barking of dogs. After waiting some time, we grew

impatient at the non-appearance of our loads, and leaving the rest of the party to take a nap in one of the empty houses, R—— and I rode back half an hour, firing signal guns. But to no purpose. Returned to the party, and sent the *zabtieh* to the people on the hill, where he ascertained that our wanderers had passed that way and were gone ahead upon our own road. We put our horses to a gallop, and when at full speed on the stony ground, Carabed came down, his steed almost turning a somersault. The horse was hurt in the head, and his rider on the knee. We however went on and soon overtook our loads. The road now led us over unequal ground, covered with bushes, rock, and hard limestone. Stopped by a booth, and roused a woman and her children, whose dog was barking frantically to defend his masters. She told us we were all right. About 3, going over a smooth road, we passed a village on our right, whose canine population came out in a body to see who we were, whereupon followed sundry canters, leaps, cracking of whips, and howlings of said canines. We were pronounced all right again, and proceeded to enter a beautifully wooded series of hills, whose verdure was truly refreshing to the eye. It was in the cool of the morning, before sunrise. The trees were oaks, of size increasing as we proceeded. About 4 we were in a complete forest of pine and cypress; the latter were not more than 20 feet in height, with spreading branches. I know not whether we were beguiled by the beauties

which surrounded us, but we soon perceived that we were completely out of our reckoning. Indeed we found ourselves landed on the top of a hill, without the smallest trace of a path, or the least idea of whither we should go next. Fortunately we had kept our sumpter-horses with us. We had forced Mahmood to ride and lead the other pack-horse, and Suleiman, who said he should keep to his feet all the way, was left behind to come on as he could. It was the last we saw of him until a day after our arrival in Afion Karahissar; and we had to do without his services on the worst roads we passed in our whole journey. We wandered about in search of information, and when obtained, it was anything but agreeable; we learned that we had failed altogether of reaching the main road from Sivri Hissar to Bayat, so that instead of making a four hours' ride from Baghlùja to the latter place, we had pursued a course which increased the distance to seven hours! We crawled down from our beautiful wooded heights into a finely cultivated valley, through which we travelled for an hour, and then crossed over the hills on the west side of it, which are almost entirely of flint, into another valley, both broader and flatter, in the widest part of which is built the town or large village of Bayat. This place stands upon what seems an artificial mound, about 20 feet in height, with a sharp projecting corner on the north side from which we approached it. We reached the place at at 8.15. Our horses were weary,

the sun was growing hot, and we had a difficult mountain pass before us. But having lost so much time, we could hardly afford to stop, and pushing on, entered a narrow rocky pass through which a torrent comes down in the rainy season. The mountains rose rapidly in height, and their steep sides were formed of broken and barren rocks. Further on, however, the slopes became less steep, and trees increased, so that we soon found ourselves in a forest chiefly composed of pines. We now made a steep and painful ascent through this forest; the face of the mountain is quite precipitous, and the road winds about between the rocks and among the trees. These mountains, on both sides of the gorge, offer as fine an example of metamorphic rock as I have yet beheld. It changes in appearance and colour every few steps of our ascent. It is often clearly serpentine, or pure clay slate, and other forms also present themselves in variety. Selenite is also seen. The trachyte appears to be the moving and transforming force. Dykes of it stand like palisades on the summit of all the mountains, on both the north and south sides of the pass; and we saw a hill of trachyte which looked as if it had but lately cooled down. Having reached the summit of the mountain in the midst of a strong and refreshing breeze, which in our heated condition was, however, not without danger, I fastened my horse to a pine tree, hung up my barometer to the branch of another, and found we stood at an elevation of 4838 feet, 1500 feet above the great

plain which we had traversed for several days. It was with great difficulty that our poor pack-horses accomplished the task of climbing up to this height. Their loads fell several times, by knocking against the trees and the rocks, and once they wandered off the path among the precipices, whence they were brought back with difficulty. Over the steepest portions two men had to support each load on the sides in order to enable the animal to go up. Oh! for railroads, or even for a plain old-fashioned turnpike, where the poorest cart might travel! I think I ought to entitle this paragraph *The Progress of Civilization in Turkey!*

On the summit of the mountain we found ourselves at once in the midst of a volcanic region, formed of pumiceous stone beneath and overlying trachyte on the top. The view from this point towards the south-west was very striking and peculiar. We had before and beneath us a vast and rough sea of mountain scenery, the foreground covered with pine woods, but all beyond bearing only short though thickly-set bushes. And wherever the mountain side was sufficiently steep, it was denuded and white with the crumbling pumice stone. The summits of the mountains were formed of dark-coloured trachyte, generally presenting a precipitous front; but under this the white rocks everywhere shone, and their crystals glistened in the sun. The hill side right opposite to us especially presented a peculiar appearance. At the first glance I thought a mountain stream was coming down in beautiful cascades over the steep

bank into the valley beneath ; closer examination, however, showed that these apparently foaming sheets of water, were only the worn fragments of the stone upon which the rain, sunshine, and frost had alternately exercised their artistic power. Our descent was rapid, but over a good road. We came upon some promising iron ore, and went down into a deep valley, where the cattle had taken shelter from the sun underneath a projecting bank of pumice stone. This rock, even after decomposition into soil, is full of shining particles. Still continuing our descent, we perceived the village of Seïdiler, built under a high rock of selenite, so decom-

Village of Seïdiler, and natural Tower with Battlements.

posed by the elements as to present the appearance of a castle with its battlements, windows, and gates, outstanding towers and fortifications. This rock stands about 100 feet in height. Behind it is a level space, which

separates it from a second and similar fort of the same height, but not so broad; this is said to contain a very extensive excavation. These rocks crown the summit of a hill, on the south side of which is erected a miserable village, with gardens and vineyards below on the edge of the plain. As we approached from the gorge, we had on our left an extensive area covered with cones of pumice stone worn into the most fan-

Cones of Pumice Stone, near Seirdiler

tastic shapes by a freak of the elements. Proceeding from this point we advanced between high banks of selenite, resembling the walls of a city, and entered the village through a natural gateway, which produces upon the mind of the traveller the impression that he

is entering among the remains of one of the greatest cities of the old world. And yet no ancient city appears to have stood here. These are all the operations of Nature herself who seems here to smile in disdain at the remains of Pessinus and Doeimæum, and the boasted ruins that are scattered throughout the length and breadth of Asia Minor.

We have descended rapidly, about 800 feet, and are not much over 500 feet above Afion Karahissar and its plain. Our horses are quite worn out. They travelled ten hours to-day and eleven and a half the day before, partly under the burning sun; it was all owing to the blunders of our guide, who lost the way. The poor young horse is pretty well used up, and we shall now have to take him along without any load, and dispose of him as best we can. We came to this conclusion in the middle of the night; I could not sleep, and rising at half-past eleven, went round to visit our poor beasts. The exhausted animal seemed hardly able to step. I called for the Kiahaya of the village and told him I wanted a horse; he replied that everybody was asleep, and we must wait till morning, and besides there were no horses to be had in the village for either love or money. I took a lantern, and putting the man before me, went from house to house, rousing the inmates, and showed him several horses I should take if they were not freely given for hire. We finally secured the horse of a man who was obliged to go to Karahissar, having been ordered, by means of a surety, to deliver

himself up to the authorities for horse-stealing. We of course kept our eye upon him and his over-smart little boy all the way.

*Wednesday, August 24th.*—Started after midnight, at 2:30, and in two hours entered the town of Eski Karahissar. This place is celebrated for its extensive ruins, and seems to have occupied anciently the same important position in the province that Afion Karahissar does at the present time; hence its name of *Old Karahissar*. We had no time to stop, and we could barely distinguish some old massive walls and loose blocks in the moonlight. We here remarked the ceasing of spring water and the beginning of wells. In all the region hitherto traversed, wells were not a noticeable feature. Indeed they are extremely rare. I know very few in Tocat, and believe they are even less common elsewhere. People depend upon running water, which is sufficient to supply the wants of man and beast. We saw the first well at Eski Karahissar, and often met with them during the rest of our journey. They are everywhere of the antique pattern of a perforated stone forming the mouth of the well, with sides well worn by the ropes or chains which have gone up and down for centuries; the long pole is balanced on two upright posts, and the old "moss-covered bucket" hangs by a chain or an iron rod, not often by a rope. We saw the first of these familiar objects in the valley of Bayat just before reaching the village, and have often since espied with pleasure from a distance the long upright pole,

indicative of water, as we plodded over our weary road, panting and thirsty under a broiling sun.

When daylight appeared we were travelling on a plateau with boulders of limestone and trachyte lying about us and cultivated fields on both sides of the road. We gradually descended over undulating ground, and among rocky hills, and at seven we entered a very smooth and level plain about four miles in width, running nearly east and west, and bounded on the south by high mountains. A stream flows through this plain not far from its southern edge; its water appeared extremely muddy, and it runs between banks of clay covered with reeds and high coarse grass. We crossed it over a stone bridge; there were evidences that much of this alluvial plain is very muddy and difficult to pass during the rainy season. The town of Afion Karahissar is built upon the slope of a steep and lofty hill on the south side of the plain. The buildings rise from the foot of the hill to an elevation of 250 or 300 feet. The mountain itself rises boldly behind it, frowning upon the town. A little in front of this mountain, and somewhat to the right as you come from the north, lies a steep and conical hill 300 feet in height, with barren and rocky sides, crowned upon the summit by a very old and ruinous citadel. The space between this hill and the mountain is occupied by the bazaars; and the town spreads round the foot of the citadel hill, as well as into a lateral valley running southward. Among the buildings thirty-seven mosques,

with their lofty minarets, make a prominent figure. We rode through a few gardens, traversed the crowded bazaar streets, where whole rows of shops recently destroyed by fire were being rebuilt, and entered the best khan of the place, called Yeni Khan. The accommodations here prepared for the ill-fated traveller were, however, anything but inviting; so leaving our horses and most of our luggage here, we were glad to avail ourselves of the proffered hospitality of two very agreeable gentlemen, Mr. Pharaon, and his brother-in-law Mr. Pelozzi, at whose house, situated high on the hill, we enjoyed good air and an excellent view of the town and castle. Hard travel and exposure were telling on all our poor horses, and we ourselves needed rest. I had, for my own part, a slight touch of intermittent fever; and so we remained at the house of our kind and hospitable hosts until Saturday the 27th.

*Thursday, August 25th.*—We had, this day, our first letters from home since leaving Tocat; they were of old date, to be sure, being of the 9th and the 31st July; still it would be difficult to conceive or over-estimate the relief they afforded in circumstances like ours. Some of our horses and both the men we took at Yozghat are giving us no little trouble. As for our deserter, Mahmood, he joined us only the day after we reached Karahissar, and came to us as coolly as though nothing had happened; when we asked for an explanation, he claimed to be the aggrieved party. Both these worthies were dismissed with full pay, but without the usual "bakshish," and

with a letter of introduction and recommendation in English to any luckless travellers they might meet to keep as far from them as they could. We took two other men to go as far as Smyrna; one of these stuck by the way, or rather we let him stick, for we found him a cypher in respect of work, but a hero in eating and taking his own ease. The other did remarkably well on the road; but as soon as he reached the end of the journey, he stole a watch and several valuable articles of apparel, and went off no one knows whither. So that this additional experience confirmed our former conclusion, that we had made a great mistake in allowing our Tocat people, whom we knew well, and upon whom we had a sure hold, to leave us. As also with our horses. I believe it is an economy as well as a comfort to travel with one's own horses; but in order to do so they must be perfectly attended to. Our grooms ruined nearly all our beasts; so that these, as well as ourselves, would probably have fared far better with our Tocat people; but under the circumstances it would have been an economy to hire all our horses as we went along, with the exception of those we rode ourselves, upon which each of us could keep his eye and bestow especial care. It is a lesson for our successors. As for such as can afford to hire the post horses at Government prices, I have nothing to say to them. But had I the money, I should never waste it in such a way, for it would be subjecting myself, at a great expense, to the tyranny of Govern-

ment officials. The pay for a post horse is at the rate of  $3\frac{1}{2}$  piastres for every hour's travel, say threepence per mile: an extra horse must be taken for a messenger to carry back those you hire, at the rate of one horse for every four, besides 2s. present to the messenger for his day's work. Hiring horses of muleteers is decidedly cheaper; the price is 30 piastres a day near the seashore, and 10 piastres in the interior, and you pay for no extra horse or rider. You can also load up to 120 okes instead of 60, allowed by the *menzil*.

We called on the *Caïmacam*, at his own invitation, and found him a more enlightened and intelligent man than any official we had yet met with. Karahissar being considered the second place in Asia Minor in respect to Muslem bigotry—Konia being the first—he certainly can meet with but little encouragement in his efforts to reform the present condition of things. It seems, however, that he keeps neutral in all matters that affect the Muslem religion, and makes improvements which have no direct bearing upon it. The reconstruction of the bazaars is going on under his care, with better ideas of hygiene than before. He has also built a new prison, which contains an infirmary, a yard, and a distinct department for the worse class of criminals. The prisoners are made to work, and are paid from 1 to  $1\frac{1}{2}$  piastres per day. He told us he is engaged in the construction of several roads, has succeeded in settling the Circassian emigrants in villages erected in woody districts, and is now labouring

to introduce the culture of the mulberry tree, for which the climate of the place seems to me altogether too severe. This plain has an elevation of not less than 3700 feet, which is higher than the mulberry is ever found in Asia Minor.

The cultivation of the poppy from which opium is extracted, is very extensively carried on here, though we were unable to see anything of it, the season being already passed. Indeed, the town derives its name from this drug, being the place where opium is chiefly collected for transportation to the sea-port at Smyrna. Afion Karahissar means the Opium Karahissar, and the latter name signifies the Black City, a favourite title given to towns by the Turks, though it is generally hard to discover the reason of it. They have many Black Mountains and Black Capes; some of their towns certainly deserve the name of Black City, Diarbekir for instance, which is built of a dark basaltic stone; but the capital of the opium district presents no such appearance, being built of mud, or of the rock of the place, which is a feldspathic trachyte, of a light colour, in which pink predominates. I could not discover that the Karahissarites were more addicted to the use of opium than other people in Turkey. But they are exceedingly fond of the nasty oil which is extracted from the seeds of the poppy, and will pay 10 piastres the oke for it, while olive oil, though brought from a distance, is sold for but 8 piastres. It certainly is very disagreeable both to the taste and the smell of

the uninitiated. I was also assured that the effects upon the system are decidedly deleterious. The Christians have long fasts, during which their food has to be cooked with oil, butter being forbidden; and they use poppy oil almost exclusively. It is said to produce eruptive diseases, and particularly a kind of itch. Hence many individuals are distinguished by the surname of *Mangy* (in Turkish *Ooyooz*).

The Turks here are extremely fanatical. Their Dervish establishment of the order of the Mevlevi (Whirling) is next only to that at Konia, which is the head-quarters of the sect, a representative of which from the latter place enjoys the privilege of crowning every new Sultan, if such a term may with propriety be applied to the peculiar ceremony performed at his installation into office, for it consists not in putting a crown upon his head, but in girding a sword around his waist. The building in which these fanatics reside here is certainly very imposing; it may well be called a palace, while the Governor of the city occupies quarters miserable enough. The Sheikh's income is as high as 4000*l.* a year. I was told, however, that the Government had recently taken possession of the property of the sect, with the promise of paying the amount of the income instead; but they actually pay just one half, to the great indignation of the holy brotherhood and their partisans.

Visited the Armenian burying-ground, which lies on the northern edge of the town, enclosed by walls,

with a porter's lodge at the gate. Saw there several monuments of antiquity, slabs and sculptures said to have been brought from Eski Karahissar, the ancient Docimæum, the present town being of comparatively modern origin. There were several pieces of marble finely carved in panels, as the ancients ornamented their ceilings. One sculpture represented men in togas standing side by side; another, masks placed at regular intervals, with festoons of flowers gracefully hanging between them; it probably once ornamented a theatre. The statues of females had lost their heads, hands, and feet; but the drapery is well executed. The best piece of work, however, is a Head of Medusa, supported by two angels, which may have belonged to

Head of Medusa: Marble Sculpture at Afion Karahissar.

the same building which contained the carved masks; this sculpture, too, has been greatly injured by the ruthless barbarians who have so long held possession of the country.

We remained in Karahissar longer than we had intended. One cause lay in the fact of our host's

generous hospitality, which led him to employ every means to induce us to remain by multiplying our comforts. European beds are a real luxury after a long inland journey, and so is a well-furnished table, and especially good wholesome bread. We should, however, have torn ourselves away sooner from these allurements but for the touch of intermittent fever, which confined me most of the time to the house. It seems, indeed, wonderful that we should hitherto have escaped, considering that we are now in the fever season; I attribute it in great measure to the little bag of Peruvian bark we all wear on the pit of the stomach, suspended from the neck, so as to be in contact with the skin. Our servant, Carabed, far better inured to the climate than ourselves, is the only one of the party who has had a real attack of the fever; and we had neglected to provide him with this prophylactic, on the supposition that he was proof against the miasma. We have been looking over the route thus far pursued from Tocat hither, and what yet remains to be done. We find the whole distance by this route from Tocat to Smyrna is 202 Turkish hours. Our rate of travel has never been so low as four miles an hour; but we have generally done our task in shorter time than is usually reckoned, so that the whole distance may fairly be reckoned 810 miles.

Some of our party have ascended the high hill at the back of the town, and have brought me specimens of red trachyte, containing crystals of feldspar, which

is the same as the rock on which the fortress is built. Indeed, I have seen no other rock about here, and it extends nearly to Balmamood on the west, where commences the formation of limestone or marl, with underlying sandstone, which appears to extend as far as the "burnt district" of Koola.

*Saturday, August 27th.*—We started at 5:20 A.M. Passed along the edge of the plain, then between rocky hills, and reached smooth ground again. There were many flocks of broad-tailed sheep in the plain. Some of them had the wool clipped in a peculiar manner, the

Caramania Sheep, as shorn at Afion Karahissar.

whole being shorn close, with the exception of the shoulders and hips. The object is to allow the best wool to attain great length, as its value is thereby much enhanced. We also met on the road a young Albinos donkey; the mother was black, while the colt, fifteen months old, was as large as its dam, and perfectly

white. It had pink eyes, and the light was evidently painful to them. Entered a narrow pass, where the road is cut down into the trachytic rock. At 8 we had before us the plain of Balmamood spreading westward; it was yellow with the ripened harvest. Reached Balmamood at 9 o'clock. It is a small Turkish village, with solidly built houses of stone, occupying a narrow gorge which unites two plains; the one extending towards the south, and the other to the north-east. I was not able to ascertain whether the latter communicates with the plain of Karahissar, or how far it extends. A small sluggish stream flows below the village toward the plain.

A good many flocks of the broad-tailed sheep are pastured here, and the breed raised in the district as well as farther south, is highly esteemed. It has been a matter of surprise to me that while so much attention has been paid in Europe to every natural production of Asia Minor, the broad-tailed sheep has not only been neglected but travellers have always spoken of it with disdain and ridicule. The poor, meek animal's burden—his ponderous tail—which in the eyes of the natives constitutes a most valuable prize, is spoken of as an unnatural excrescence; and it seems to be thought the animal is esteemed chiefly for his odd and unnatural appearance. I believe, however, that this creature constitutes one of the most valuable possessions of the people of this land, and should greatly regret to see the breed exchanged for

any other, not excepting the merinos. True, the wool is not fine, and cannot be employed for the most delicate textures; it supplies, however, what is most needed by the common people—a staple for manufacturing cheap, coarse, and warm garments and excellent carpets. But the flesh of the animal is superior to any other breed on the face of the earth. Beef cannot be raised here, as in Europe, for lack of abundant grass: though the cattle of the interior mountain district will compare well with those of Europe generally; and I cannot doubt that when railroads reach those spots now inaccessible to commercial enterprise—which they will certainly do, and that at no very distant period—the butchers' stalls of Smyrna and Constantinople will be garnished with as good beef as can be found in most large cities of continental Europe, surpassed only by "the roast beef of Old England." But even in such a case, the mutton of Asia Minor will maintain its superiority to that of every other country in the world as long as it is despised by foreigners. The natives fully appreciate the economical value of the broad-tailed sheep, and it has nearly supplanted every other breed in the Peninsula. Fine rams fetch a high price, and you see them kept in all parts of the country solely for breeding purposes. Nor is the broad and heavy tail the least valuable portion of the animal: it is wholly composed of fat, which differs essentially from tallow or any other fat excepting lard. Its delicacy enables it to take the place of butter for culinary

purposes, and it is, in many respects, so far superior—while also decidedly cheaper—that in most parts of the country butter is not manufactured because it is not needed; milk is there made into cheese only. Moreover, “tail’s fat,” as it is called, is as much an article of merchandise here as any other necessary or comfort of life, and a market unsupplied with it would be deemed poor indeed. It fetches a medium price between tallow and butter, and is almost entirely used by the natives instead of the latter. There can hardly

Caracul Sheep, unshorn.

be a doubt that this animal would succeed in Europe, for it is hardy, and the best breed is raised in Cara-

mania, a high and cold district in the southern portion of the Peninsula. The wool, indeed, might be improved by crossing with some other breeds, and it would then recommend itself not only as the best article of food of its kind, but as offering at the same time a valuable staple for manufacture.

I give the reader two sketches in illustration of this peculiar breed of sheep, the first of which represents him as he appears when his wool has acquired its greatest length. The form of the tail cannot be distinguished, being hid by his shaggy coat; but the illustration below will explain the form of this part of the animal's body. It is composed of two lobes,

Carumania Sheep, completely shorn, showing the form of the Tail.

the bone of the tail passing between them, and projecting like a small tail beyond them. It has been supposed that this peculiarity is the mere product of over-feeding; but there is no foundation for such a supposition. Were it correct, this animal's tail would be similar to that of any other sheep when in a low

condition; but this is not the case, for, whatever his condition, whether fat or lean, his tail is always broad and large, and resembles very much the mats or cushions worn by the savages of some of the Pacific Islands fastened to the girdle behind their backs, the object of which is to save them the time or labour of reaching out for a chair when they wish to sit down. Only the poor sheep cannot sit upon their tails, but must tug them after them wherever they go.\* The condition of the sheep has, therefore, very little to do with the size of their appendage, and nothing at all with its form. There is no doubt that this is only a distinguishing mark of a particular breed, just as two humps are of the Bactrian camel. This and all the other peculiarities of the breed can be propagated by the process of generation, and that alone. It is useless to inquire how these peculiarities first originated, for such an inquiry would probably lead to no practical result. We must now take facts as they are. We cannot, on the basis of a theory, set a train of operations in motion by which we may hope, in the course of a few centuries perhaps, to convert a common goat into an Angora *Teflik*, or an ordinary hack into a thoroughbred Arabian. Just as hopeless would be the task of making a broad-tailed sheep out of any other mutton now in existence. It is a distinct breed, which

\* We have seen a tail so cumbrous that it had actually to be carried upon a little cart made for the purpose, and drawn by the animal.

commends itself for many of its valuable qualities, and I believe other lands would gain much by its acquisition.

Being on this subject, I will mention a four-horned sheep, which I do *not* regard as a peculiar breed, but only as a *lusus naturæ*. It is occasionally seen in Asia Minor, as in other countries. These animals are regarded with a sort of veneration, or perhaps as curiosities, by the natives—it is hard to say which—

Four-horned Sheep.

and they are kept as pets. I saw a broad-tailed ram in a khan, where he roamed at liberty, and was petted both by the host and his numerous guests. Whether from lack of food, or owing to the experiments made by all these people, he had acquired the power to eat whatever was set before him; I saw him even eat tobacco with apparent relish. His horns were of various lengths, and the side ones could not have done much more than protect his ears from the attacks of an enemy. I have, however, seen even chickens with horns on their heads, and those, too, of considerable length.

::

;

## CHAPTER XXV.

Departure from Balmamood — New servants and companions — Forest on fire — Ride in the dark — Village of Chiflik — The Sabbath rest — Manufacture of opium — Bactrian Camel — Village of Islam Keuy — Valonea oaks — Village of Bozghoor — Town of Ooshak — Manufacture of carpets — Geological formation — Village of Geuneh — A robbers' trap — Village of Muzuk — River Hermus — Former residence of a Dereh Bey — Bridge over the Hermus — Arrival at Suriyeh.

CHIFLIK, *Saturday Night, Aug. 27th*—We rested for the middle of the day in the shade of the piazza of the small mosque of Balmamood; the inhabitants were truly hospitable, and supplied us with everything we needed. The day was very hot; the only breeze, and that a very light one, being from the south. We started again at 2.45. The weather was exceedingly oppressive, and the road very dusty. We have, thus far, gained much in the change made at Karahissar in the *personnel* of our company. The two new ostlers are active and good-natured for the present, and they get on well with the *caterji* of whom we have hired our pack-horses. They started, at their own request, one hour before us, and we did not overtake them until 5.45. Haji Eumer was walking, and Ismail

was riding a donkey which he has brought along, and proposes to sell for a high price in Smyrna. We have in our company an old Arab of Baghdad, who travels with us at the request of the Caïmacam of Karahissar. He is a fine old fellow, and very popular among all the Muslems we meet. We feared he might be somewhat of a leech, but find him of an altogether different genus; he always chooses another stopping-place than our own, both for himself and beasts, and settles his own bill. True, his funds were exhausted shortly before we reached Smyrna, and I advanced what he needed, but he paid it back on our arrival. He travels with two fine white donkeys, which he is taking as presents to a relative, who is chief of the Smyrna police. One of these creatures is very fine, and he told me he had paid 100*l.* for it. The hair of its neck and tail is dyed with *henna*. This he rides himself, and his servant, a good-natured young Arab, generally bestrides the other; they have no difficulty in keeping up with our horses.

At 5 we left the village of Duz Aghach (the Smooth Tree) on our right; it is a place of considerable size, and has some trees about it. The plain now narrows into a valley. The sun disappeared at 6 by our watches showing that we were considerably behindhand in our reckoning. When we first came in sight of this plain in the morning, we had noticed a smoke on the mountain south of it. It had been increasing all the morning, and as we passed opposite to the spot along our path, it had become a great fire in the forest. The

sight was truly fine. We could see the tall and massive pitch-pines standing out in distinct relief in front of the flames, which were ever and anon bursting with devouring energy, and sending up clouds of black smoke or forked tongues of fire, which vanished in the air. We could sometimes distinguish the remorseless element leaping on one of those veteran denizens of the mountain, and twining itself, like a monstrous snake, around its venerable trunk and its hoary branches until it clothed it with a blazing and scorching garment. The fall of the aged tree was announced by the sudden rise into the air of a thousand sparks and a fresh outburst of smoke and flame. It is probable that the fire had already committed extensive ravages, for smoke arose from a very large portion of the mountain extending in a southerly direction; the smoke of this conflagration seemed to give heaviness to the whole surrounding atmosphere, and to render it oppressive, instead of producing a draught of air. There were a few clouds in the sky, but they were light, and the smoke gradually formed into a straight line, which, from our position, seemed to make directly for the setting sun. The western sky assumed a bloody hue, and the clouds above were painted with the most gorgeous colours.

The darkness of night advanced rapidly upon us after the sun had set. We reached the end of the plain, and ascended over broken ground, our horses stumbling in narrow gulleys and among rocks. It

soon became so dark that each rider could only distinguish the tail of the horse that went before him, and not even that if he lagged a few steps behind. We let our horses have the reins, and went on like blind men, only guessing by the sound when we were passing through water, on dry land, or among stones. We finally saw lights, and found ourselves in the village of Chiflik; came to a door, and hailed; and, after being led a good deal hither and thither about the place, were finally ensconced until Monday morning in the upper story of a respectable building, with two tolerably clean rooms and an open piazza at our service—the holes in the boarding under foot not quite big enough to let us fall through into the stable below, and the window capable of being closed by spreading a blanket in front; and then a hasty supper, and “to bed, both man and beast.”

*Sunday, August 28th.*—We were constantly rising yesterday, and have now attained an elevation of 4424 feet, which is more than 700 feet above the plain and lower portion of the town of Karahissar. This is the highest spot where we have lodged for the night, on our whole route from Samsoon to Smyrna, with few exceptions.

We had our usual Sabbath services this morning; but all the natives here being Muslems, no one could join us in addition to our own party. These seasons of Sunday rest, religious reading, and prayer, have been very refreshing all our long and weary way. I do not

believe either we or our beasts would have been able to stand the wear and tear of the journey without these regular seasons of rest. Many travellers lose much by breaking the Sabbath, under the notion that a necessity is laid upon them; that the Sabbath is no Sabbath at all under such circumstances, and the like excuses. Most unfortunately, the impression produced upon the minds of the native population is extremely injurious. They have an idea in consequence that all the "English," as they call Protestant Europeans, are infidels; for they cannot conceive of a religion which has no outward manifestations whatever; and infidelity in their view is a stigma which annuls every other quality of uprightness, justice, and purity of morals, which, in such a case, can be only apparent, not real. It often happens, especially when travelling, that several men sleep in the same room on the floor; and our native Church members, in such a case, never hesitate to offer their morning and evening prayer kneeling in the sight of all present, though they abstain from "raising their voices on high," as they do when alone. And they are right. They reason that Turks, Jews, and other religious sects, do not hesitate between kneeling in the presence of other men and performing their devotions in an unsuitable posture; and I believe they judge correctly. Outward posture means more in the East than it does in the West or North. I have often had occasion to go into a native brother's room while engaged in his private devotions, and my in-

trusion has never made him do more than lower his voice.

This village, so far as appears from our lodgings, seems in a well-to-do condition. It appears of considerable extent, and trees, principally willows and poplars, shade it here and there. This is the first place where we have seen the poppy cultivated for the purpose of obtaining opium. Unfortunately, however, the crop has already been gathered in; there are fields close to our house where it was sown, and seed-vessels of the poppies have been left behind. The mode of cultivation was described to me as follows:—The seed is scattered broadcast in a field, which is carefully enclosed. When the plant has attained a certain size, each stem is tied sufficiently tight to prevent the sap from rising higher, and an incision is made for it to ooze out; the sap, indurated by the heat of the sun and evaporation, constitutes opium. The flowers are white or red. After extracting the juice in the manner described above, the plant is allowed to bring its seed to maturity by unfastening the tie; and this seed constitutes an important part of the value of the crop, oil being manufactured from it, as previously stated.

The hills beyond this small plain are covered with forests, which accounts for the houses' being wholly built of wood. We have thus far found that in all the villages from Karahissar westward the people make hay, which they keep in heaps either upon the flat roofs of their houses or upon the ground; in the

latter case it is preserved from the cattle by means of a wooden fence.

*Monday, August 29th.*—Weather cloudy and threatening. Rose at 3.30. Our “new brooms” continue to “sweep clean.” Were in our saddles at 5.40, and, soon after, met the finest Bactrian camel we had yet seen. He appeared very gentle, had neither halter nor pack-saddle; his majestic form was wholly uncovered; he moved like a colossus, followed by two Turkmens, who appeared to guide him in the direction he was going.

Male Bactrian Camel.

I asked them to stop so as to allow me the opportunity to sketch him. And he remained motionless all the while I was drawing. The men told me they belonged to the people encamped close by, whose tents we could see; there were many camels feeding

in the neighbourhood. This animal they said was never loaded, but kept solely for breeding purposes. His humps were well marked, and so high that they both hung over on the right, having a tuft of hair at the extremity. Like all the camels of this breed he had long dark hair on the top of the head, around the throat, in front of the whole length of the neck, and on the upper part of the forelegs. His form clearly showed the distinction between the Bactrian and the Arabian camel; the length of his body was very great in comparison to his height. He was a heavy, muscular, and powerful animal, the largest I ever saw of the camel kind.

At 6:30 we reached an elevation whence we had a very fine and extensive prospect. A heavy mass of thickly wooded mountains lay in front of us, with a very considerable stream flowing along on our right. Underneath our feet were cultivated fields and a village among them. The clouds which had hitherto hid the rising sun were partly broken up, and thus light and shade were cast upon the whole scenery, while the summits of the mountains were enveloped in clouds and rain. We had so long viewed the sky as brass, and the parched earth had so long dazzled and strained our eyes with the reflection of a scorching sun, that we could not turn our faces for a moment away from the refreshing prospect around us. We came down the hill and passed an old Turkish fountain standing by the wayside. It has four faces, and is supported by an

---

ancient pillar at each corner. At eight descended into a valley watered by a small stream which runs westward. The rock had heretofore been friable marl, but it now became more compact and less laminated, and gradually passed to sandstone and conglomerate. The hills on both sides of us were covered with pine trees which, as the clouds disappeared, refreshed the eye with their agreeable verdure. At 9 we reached a dervend, or guard-house situated in a gorge, and found in it two young men who acted as guards. This region being occasionally infested with robbers, we had been advised to keep near our loads, and had thus come on at a slower rate than usual. This café is three hours from our last stopping place. We remained here for ten minutes to take the regulation coffee, and proceeded through the valley. Trees are scattered about among cultivated fields, whose owners live in villages out of sight from the main road. They are for the most part walnut and wild pear trees, and I saw a few stunted cypresses. The trunks of the walnut trees are short but very thick. Soon the valley somewhat widened, and we came at 10:30 to the village of Islam Keuy, and passing through several of its filthy streets and by a very plain mosque ornamented with a large wooden minaret whose balustrade is of the same material, we reached the Kiahaya's house where we stopped for food and rest. Found here a Smyrna Greek engaged in trade, and had the pleasure again of speaking that language. You rarely meet in the Interior any Greek

who is acquainted with his native tongue, so completely have the ruling race succeeded in abolishing it and substituting their own dialect. The weather had been extremely variable all the morning ; but the wind was high from the east, so that the mercury in my barometer doubtless stood lower than it would under other circumstances ; as it was, it gave me 3250 feet, which shows that we had descended nearly 1200 feet from Chiflik in the course of the forenoon. Started again at 1:30, still keeping company with our loaded animals ; entered an extensive grove of valonea, which spread in all directions as far as the eye could reach, even when we stood upon high ground. There were a few bushes, but the soil was mostly planted with fine trees of this species of oak, whose shape is regular and graceful, and some specimens attain a considerable size. The valonea acorn was only partly developed, being in the shape of a ball of green leaves two inches in diameter, the acorn itself not having yet come through. The foliage was very thick so as to afford a pleasant shade, in which we repeatedly avoided the burning rays of the sun. At 2:45 we reached a fountain with a cemetery near it ; the water was warm and brackish. The gravestones consisted of slabs of sandstone, calcareous marl, and metamorphic rock, all of which it would seem are to be found about here. Farther on we enjoyed a very extensive prospect, the unevenness of the soil enabling us to look over the forest of valonea oak, which extended for a distance of

five or six miles. Saw Koordish tents and cattle a little distance off, and met a Koordish boy who was engaged in watching a herd of cattle and busy, at the same time, in spinning some of the coarse wool which that people make into carpets. Spinning is the general occupation of shepherds throughout the interior while tending their cattle, and the immense flocks of sheep which travel from the region of Kars to Constantinople are generally led by a man thus engaged.

At 5 descended through a village into a rich alluvial plain, and stopped under the fine pine trees which skirt it to drink from a fountain that flows from the rock. The view westward from this spot is extensive and fine. The ground slopes down to the plain which though alluvial is still undulating. No valonea is seen in it, which indicates that this tree requires a dry soil, such as is produced by the decomposition of the sandstone. In the plain are seen here and there clusters of trees and verdure, and occasionally tall poplars. The villages are mostly hid in orchards of mulberry and fruit trees; we could see the minaret of the village where we intended to stop for the night shining in the light of the setting sun. We now ventured to push ahead of our loads, and made the hour and a half to Bozghoor by 6:15. This village contains about sixty houses and one mosque, whose minaret is an elaborate structure which does not at all correspond to the style or appearance of the building to which it is

an appendage. As we entered the village I noticed that the women went about quite unveiled, and without appearing to show any feeling on the point, and that this was the case even with the old and the homely. One of these was walking quite uncovered straight towards us, and when she noticed us she continued just as before, only standing where she was, gazing with the stare of astonishment and curiosity, but without evincing a particle of bashfulness. Our inquiry for a lodging place procured us rooms in the best house in the village, whither some other travellers appeared to have preceded us. It belonged to a wealthy Turk who was absent. One half of the house was occupied by his harem, a small door upstairs leading into it, which was guarded by a powerful dog. All the apartments were in the upper story, the lower being occupied by the stables. A large verandah gave us air and a good prospect upon the enclosed grounds and the village. The room where we slept was spread with two small carpets from the famous Ooshak manufactures, the delicate pattern of which was finer than anything I had yet seen.

*Tuesday, August 30th.*—Rose at 3 and started at 5. The plain is undulating and well cultivated, studded with villages embosomed in gardens and orchards. We reached Ooshak at 6:30. It is a large town, of purely Turkish style, situated in a natural hollow of the plain; the houses are of mud bricks, only partially plastered over. Streams of muddy

water flow through the streets and pass under some of the buildings. The mosques are mean, but their minarets fine; there are some ten or twelve of them, tall and well shaped. Many of them are fluted on the outer surface, the fluting being made to wind around the body of the minaret. The sharp domes of all are covered with tin. We stopped at the principal khan in the place, called as usual *Yeni* (or *New*) *Khan*, a building with a narrow oblong court, lying not far from the edge of the town, and gave ourselves the luxury of fresh fruit, which is not to be procured in the villages. We had the good fortune to have a letter of introduction to a *Sciote* merchant, *Mr. André Glisse*, an old resident, or we should have seen nothing of the place. He was extremely kind to us, insisting upon giving us an early dinner, and taking us round the town to see the celebrated carpet manufactures. We were fortunate enough to have an occasion somewhat to repay him for his kindness by setting up for him a cotton gin which had just arrived, the first ever introduced here. He informed us that the crop of *valonea* will be ready for gathering in about a fortnight; after picking the fruit of this species of oak entire, it is left to dry until the acorn becomes somewhat loose, when it is removed with a nail. There are no shops, much less a factory, for the manufacture of carpets, but they are made in private houses, both *Christian* and *Turkish*. The work is done exclusively by the women. There are two kinds of carpets made here. The plain is woven

like ordinary cloth, but in patches, each colour by itself. In both cases the loom upon which the framework of the carpet is stretched from top to bottom stands on one side of the door entering into the yard of the house, and the women who do this work squat down in front of it. Little girls are busy bringing the woollen thread of different colours as needed. The woven carpet is made very rapidly, and is necessarily cheaper than the other, while it is inferior in appearance and durability. The Turkey carpet, as it is called in Europe, is made by a very laborious process. Every stitch requires a separate thread, which is tied with a peculiar knot to the perpendicular twine, which is laid regularly, up and down across a frame as wide as the carpet is to be. The ends of the thread are then cut off, but not close, another stitch is tied in the same way by the side of it, and so on. The stitches are thus made one by one in a horizontal line, and when the row is completed a stout strand of red woollen thread is passed three times across, interwoven in the perpendicular threads with the hand; they then press down that and the new row of stitches with a wooden comb, and cut all the ends of the threads smooth with a pair of shears from right to left. They appear to have the patterns in their minds, though they occasionally consult the finished portion which is gradually rolled up underneath. Some of the designs we saw were very pretty, particularly some flower patterns, and a small Persian design. I

was informed that these women are able to imitate any pattern sent them, and a beautiful carpet had lately been made for a gentleman in Smyrna, the centre of which represented the arms of Italy.

The Rayah population of Ooshak consists of 150 Greek and 50 Armenian houses, there are no Papists. The elevation above the sea given by the barometer is 3137 feet, indicating the continuance of the plateau which occupies most of the interior of Asia Minor, though there is a gradual descent as we advance westward. From Ooshak the plateau continues to diminish in height, though we shall still travel upon it until we have passed Koola.

We were again in our saddles at 2 P.M. and ascended a small hill, from which there was an extensive prospect of vineyards and orchards on our right. There are several mill runs about here, and they are lined with tall poplars. Further on cultivation almost entirely ceased; but the hills were covered with a thick growth of bushes, mostly of oak. We passed along some fine bold ravines cut through by the stream we were following, and which is the same as that which flows through Ooshak. Rode on the right or northern side of a narrow valley until about half-an-hour from Geuneh. At 3 found some blocks of fine obsidian, the first indication of volcanic action, which henceforth multiplied as we proceeded westward. The rock, however, both here and for a great distance to the west belongs to a formation of strongly stratified lime or

marl, containing impressions of shells. This stone is sometimes quite soft and is easily decomposed, forming a rich and fertile soil.

The strata are very nearly horizontal; it often alternates with a conglomerate, having a basis of sand or soft marl. This conglomerate being more compact than the limestone occurring with it, the latter is often worn away leaving the harder rock isolated in strange and fantastic shapes, resembling somewhat the pinnacles of Seïdiler. Again the marl is worn away from beneath the sandy conglomerate, and leaves it standing suspended in the air. In one place I found the rock strongly impregnated with sulphur and copper, giving it a yellow and green hue. There is considerable volcanic disturbance in some parts, and the occurrence of obsidian points the same way. Sometimes also the limestone assumes the appearance and hardness of flint, probably from igneous causes. Masses or boulders of other rocks are occasionally found, having probably been brought hither by some convulsion of nature or by glacial action. These parts are said to abound with partridges, and people come from Ooshak to shoot them. The ravines, however, are favourable to robbers, and we subsequently learnt that a deed of blood had been committed upon this road the day before we travelled it. We reached Geuneh at 6, a most miserable, ruinous, and dirty village of half-a-dozen houses standing, though there are ruins of many more. This must have been an important town at some period, if

we may judge from the public buildings yet remaining. There is a handsome mosque and minaret of considerable size. An isolated minaret of brick, without its pointed spire, marks the spot where another mosque once stood, and a third in ruins has lost dome and minaret too. Our quarters here were decidedly the worst we had yet encountered; our host's boy attempted to steal, and when reproved for it drew his knife. Fortunately, however, we were too many for him, and he gained nothing thereby. We also had some trouble with the *zabtieh* furnished us by the Governor of Ooshak, who was to have gone with us as far as Koola. He insisted upon having the best quarters in the house for himself, was scolded roundly, and went off in a pet to another place. Next morning we caught sight of him as he was pursuing his loose horse among the ruined houses, and he shortly after went back to Ooshak without even calling for the customary *bakshish*. We have descended nearly 900 feet from Ooshak, *i.e.* in a distance of about 15 miles.

*Wednesday, August 31st.*—Started at 5.30 and at 6 reached a spot which has become famous for the highway robberies there perpetrated. It is a regular trap, and so perfectly adapted to the object in view, that all it needs is the living springs to work it. The robbers' hiding-place is upon two small natural mounds upon the outer edge of the road, where large stones are arranged for the purpose of screening them from view. They allow the caravan to reach a circular spot between these

mounds, and then effectually prevent their advance or retreat—for the precipice on the right and the high rocks on the left render flight quite impossible in those directions. All the robbers have to do is to show themselves from behind their hiding-places and to give the caravan the order to stop; in case of resistance, they can shoot down the travellers without danger to themselves. At 6.15 we descended again into the Muzuk valley, so called from a village of that name, which we passed at 6.30, situated on the opposite or north side of the valley. The valonea oak here grows abundantly on both slopes of the valley, the lower alluvial ground alone being cultivated. Yuruk tents were lying about among the trees. It is in this valley we first came upon the Hermus, which descends from a lateral valley running up to the north-east. It is now 10 to 15 feet in width, and but a few inches in depth. Our course hereafter lies in a great measure by the side of this stream, though we shall often lose sight of it altogether where its banks are too rugged to leave a foot-hold for the traveller, or where its lengthened windings render a shorter cut desirable. The rich and promising soil lies mostly unused, and the population is extremely scattered and wretched. Going over a hillock saw the Chiflik house, and stopped at the café at 6.45. It belongs to some Greek gentleman, and lies in a pleasant position among hills covered with valonea oak. Its cultivated lands are in the valley below. We were hospitably entertained here, and left at 7.15. Came down again into

the valley of the Hermus, and the lands belonging to the Chiflik, which are planted with vineyards, flax, and grain. Continued on the same side of the valley and stopped a few minutes to shoot some partridges—which are said to abound here—for a meal. We were told at the Chiflik that a man had lately shot twenty-two brace in one day. The Hermus, along which we rode, had increased already to 20 or 25 feet in width. At 8:30 reached the village of Yenishehir, consisting of some houses mostly in ruins, built upon a slope facing the north-east, and occupying the foot of the pass over the stony and steep Chatal Tepch or Fork Mountain, which is in full view, with the two rocky points which give it the name. The Hermus here turns to the north and finds further on a way round the obstruction presented by the mountain. The rocks in that direction have a very dark colour. Here mica slate has taken the place of the limestone. This village must once have been a place of size and importance, from its extensive ruins. The buildings, however, mostly of mud-brick, unbaked, are being rapidly obliterated by the rains, and it certainly is now the very opposite of Yenishehir, the New City. On the highest part of the slope it occupies are the ruins of the former residence of a Dereh Bey, consisting of a piece of ground, some 200 by 400 feet, enclosed by a stone wall 20 feet high, with a square tower at each corner. In one of these towers is an underground prison. The whole enclosure is divided by a wall into two portions—the part

toward the village being for the men, or the selamlük, and the other for the women, or the harem; each had its own outer gate, and there was a door of communication between the two. Each also had its own house and outbuildings, resting chiefly upon the north-west wall. The houses are quite in ruins and uninhabitable; but much of the timber still supports the mud-brick structures. Most of the walls, however, are built of irregular pieces of mica slate taken from the mountain side, united only with mud. This was once the residence of a Dereh Bey, or independent Muslem chieftain, and his stronghold at the foot of the pass doubtless enabled him to levy black mail upon the travellers who frequented this important thoroughfare. It was easy to imagine the busy scenes which once occurred on this spot, some centuries back; now, however, all is silent. The yard has become a goat and sheep's pen. Three fine minarets, built of red bricks, attest, as at Geuneh, the former existence of fine mosques; two of them have lost their pointed spires, but the third has lately been repaired, as well as the mosque to which it belongs. The comfort of clean quarters and the hospitality of our Turkish host made us forget the unpleasant experiences of Geuneh.

Handsome minarets appear to have been the rage in this region some two or three centuries ago, for we found them not only in so large a place as Ooshak, but in such villages also as Bozghoor, Geuneh, and here. There is no doubt that these were once places of con-

siderable size; but their present condition not only indicates a striking diminution of the Turkish population, but also of the religious zeal of the Muslims. Indeed one is struck with the universality of these two facts while passing, as we have done, through the central portions of Asia Minor. We have not yet found a single town that presents indications of growth. New houses are extremely rare—ruinous ones very common. Fields lie uncultivated; vineyards and orchards are running wild and overgrown with grass and weeds. At Afion Karahissar the Government was rebuilding some of the shops; besides this, there were a few new villages built by the lately-imported Circassians, but they looked miserably poor and filthy. An observation showed the elevation of Yenishehir to be 1776 feet, or nearly 300 feet below Geuneh, our last stopping place. We left this village at 2.15, and went immediately up a very steep ascent. The road was mainly cut or worn among the rocks, and often so narrow and steep, that a loaded animal passed through with some difficulty. Our course was zigzag up the hill of mica slate, which was too steep to be overcome any other way. The dip of the rock has a strong inclination toward the south-west, and is greater on the western than on the eastern side of Chatal Tepéh. It seems that some efforts have lately been made to improve the road, for we found the rock had been blasted in several places. We reached the summit at 3.15, and began to descend. This was done very

gradually and along a comparatively easy road; and in so doing we went round the mountain, skirting perhaps one-half of its circumference. The view was very extensive and picturesque. On our right was a broken mountain region, with deep and rocky ravines, apparently all of mica slate. At some distance west and north-west beyond this mountain we could distinctly see the limestone formation in the valleys below, the white marl cropping out from the verdure. Where the soil has not been washed away the mountain is covered with grass, scrub oak, the wild acacia, called Judas' tree, and some valonea oaks; partridges must be very abundant here, for though we saw none yet, we could hear them singing in every direction, and the path was covered with their tracks. At 3.40 we again caught sight of the Hermus; it was dashing among the rocks and narrow openings in the mountain, coming down from the north to pursue again its western course. As it leaves the mountain its bed widens, although but a small portion of it is covered with water at this season of the year. A valley opens farther west, and we can perceive the black tents of the nomadic Yuruks scattered here and there in it. We saw the village of Tash Keuy, "stony village," on the mountain side below us on the right, and soon after at 4 reached a guard-house, situated upon an eminence and commanding the road. There were two men stationed here, and they told us they remain during

the whole winter upon this spot, the weather being sometimes very severe. Looking down from here, we could see the bridge, whose single arch spans the river; it appears very narrow and high. The undulating plain to the west has now come in full sight, and it is fertile and well cultivated. We continued rapidly to descend, and at 4:30 reached the bridge. Its main

Bridge over the Hermus.

arch is very long and high, and the river passes under that alone, except when it overflows its banks, in which case it runs also under the small arches on either side. The bank at each end of the bridge is high, but I suspect even that is sometimes covered with water.

The parapet is partly broken down, and the ascent and descent over it is steep and narrow, the base of the structure being much wider than the summit. It is a Turkish work. The water of the Hermus is now very low and everywhere fordable; where we crossed it the greatest depth was 1 foot 6 inches. Some of our animals found it so agreeable that they got away from their masters and attempted to continue the journey down the stream. We now followed the right bank of the river along a path which ran by the base of the overhanging mica slate cliffs. Large platanus or plane trees grew here and there near the water, and our old friend the *Agnus castus* lined the banks of the river; we had not seen it since leaving Smyrna, and it seemed to give us the first welcome home again. We soon ascended a knoll and found another guard-house. At 5.10 the rock which had been mica slate from the time we had set foot upon the mountain side at Yenishehir changed again to friable and well-stratified limestone and marl; but the change was not sudden. The mica slate began to contain larger and more numerous pieces of quartz; the mica then became more rare, and at last totally disappeared, the stone assuming all the characters of what is called quartz rock. Marl soon appeared to be mixed up with the quartz; the latter disappeared in its turn, and we had reached the marl or limestone formation. We now moved along the plain where the Hermus makes a bend to the left; passed over some

*harmans* or threshing-floors, forded the river, and went up a steep and high bank on the other side to the village of Suriyeh, which is built on ground at a considerable elevation above the stream. We were taken to the Governor's house, who was very polite and attentive, and there our persons and animals were well cared for.

 Smyrna—Home again.

**T**HURSDAY, *September 1st.*—An observation taken  
 this morning shows that we continue to descend,  
 though slowly, toward the western plains; this is also  
 proved by the course of the Hermus. I gave medicine  
 to a sick man last night, which did him so much good  
 that a number of applicants came this morning upon a  
 similar errand. My medicines, however, were packed  
 up, and I was ready to start, so that I was obliged to  
 decline the aid requested. We left at 5.25, and rode over  
 a hill into a valley. Before us extended a steep mountain,  
 formed of marl or soft limestone, its face washed and  
 worn down into deep gulleys and irregular forms. The  
 top of this hill appears to be a far-stretching plateau,  
 composed of a layer of lava about 100 feet in depth.  
 On our left, too, we had a similar mountain, so that we

were travelling in a fissure, about 1000 feet in depth, cut into the marl and its superincumbent lava. The bottom of this fissure, or gorge, forms the bed of the Hermus, generally too narrow to allow a road upon its banks. Our path led us over the detritus, which lies in masses of more or less elevation on the right and left. As far as we could see, the upper layer of lava appeared everywhere of equal thickness, and seemed from where we stood to have a columnar formation. Came down to the Hermus at 6:30 by a smooth little valley, an enlargement of the gorge. The river here flows in a south-west direction. We found mica slate in place at the bottom; above it lies the marl, and the lava on the top of all. Fragments of the last lie all about us, which were probably broken from above, and were too hard to be decomposed and washed away like the marl. It once formed, I am persuaded, a general crust over the whole limestone formation, and it continues to break down and fall from above as the underlying marl is giving way under the influence of the weather and the river. We crossed the Hermus, and going up the steep bank on the other side reached the guard-house at 5:50, where we waited for our loads to come up. We had been told that there were forty Turkmen robbers in this pass; but we, certainly, saw nothing of them. We at first kept by our loads, but left them to come on behind us in the vicinity of the guard-house. This is built upon a hillock which commands a view of the road on both sides for a considerable distance. The

river passes at the foot of it and winds about in the chasm. The spot is highly picturesque, the nearer bank of the mountain being very steep, the marl worn into the most extraordinary forms of chimneys, minarets, domes, cavities, and honeycombs, and the whole surmounted by a broad line of black lava. The hillock on which we stood was of mica slate, which underlies the marl, and stretches out in a southerly direction. There are pieces of lava lying all about, however, and the columnar formation of the broad layer on the crest of the mountain is still more distinct than before. We took a man here to show us the way, and left the guard-house at 7-20. Passed among the tumbled rocks close under the overhanging cliffs, with the Hermus on our left. The partridges were singing on every side amid the echoes of the mountains; but they kept out of sight. As we rode along close to the foot of the cliffs, we had to pick our way among large pieces of lava which had tumbled down from the top; many of them showed the columnar form, which gave the appearance of ribs in their sides. These were quite smooth, each surface being about six inches in width; otherwise the substance of the lava is very uniform. As we looked up, in places, we could clearly distinguish the columns in the lava standing perpendicularly. In one spot, however, these were contorted.

There is a piece of lava as large as a good sized ship, which has fallen from above, and has alighted near the road; its shape and position is very much like a vessel

lying on the stocks, and the columnar surfaces well represent the planking on the ship's side. This rock has long attracted the attention of the natives, and has given its name to the place; for it is called *Gemi Dereh*, the Ship Gorge. We now came close to the bank of marl, and saw the explanation of the fantastic shapes we had noticed. The foundation is mica slate: then comes a mixture of fragments of mica slate, quartz, sand, and clay. It is the soil formed by the decomposition of the mica slate rock. It is precisely like the soil we had already seen lying upon a mica slate bottom, and which we had farther on a still better opportunity of studying. The quartz pebbles prevail in it; for they are the hardest portions of the rock, and they longest resist decomposition; though in the rock itself they occur only in numerous veins, yet they prevail in the soil into which the rock disintegrates. Above this species of conglomerate, is a layer of clay or marl, of different thickness in different places. Then comes a narrow bed of sand and small pebbles, and marl again, thus forming alternate layers of gravel and clay, the former much thinner than the latter. The weather wears away the clay, while the gravel holds longer together, thus producing the fantastic shapes we see. At 7.45, came quite down to the bank of the Hermus, at the ruins of an old bridge, but continued to travel on the north side, upon a narrow bank lying between the river and the cliffs. The valley soon widens; we forded the stream and went up a hill toward a village on the other

side. The Hermus now runs north-west, and we lose sight of it altogether. Rode over an undulating, sandy ground, which is simply decomposed lava, with large fields of melons and water-melons on both sides of the way. Found by the road-side two small stone enclosures, roofed with branches of trees, in which are kept jars of water, quite cool; and following the custom, as we were told, we stopped and took a refreshing draught. The hills lying to the west of us, and near our road, are of lava, regularly rounded and conical, presenting the appearance of extinct volcanoes; but their sides are smooth and under culture. The ground gradually ascends. We now entered a narrow pass, when Koola burst all at once upon our view. It seems to be a place of considerable extent, built upon unequal ground. The houses are all covered with red tiles, and there are some good-looking minarets. In front and on the right is a long line or wall of black lava, in broken masses, which has flowed out of the now extinct volcano on the north-east side of the town. It resembles a rough and surging stream, which assumes odd and fantastic forms. The old volcano which threw it out lies about two miles on the right, and the stream of lava can be traced down its western side; it is called Devlit, or the Inkstand, by the natives. No crater is visible from below: its form is somewhat irregular, and a narrow path can be traced ascending to the very top. The houses of the town are built of pieces of lava and mica slate, mud alone being used for cement. The walls are everywhere

of a very dark hue, resembling those of Pompeii. The streets all have high side walks, made of slabs of mica slate; and the portion left between for horses and cattle is narrow and unpaved. This is made still narrower in many places by the frequent crossings. We stopped at a large but ruinous khan, where they gave us a small room which we soon perceived was already tenanted by a variety of vermin sufficient to satisfy the keenest entomologist. But we were fortunately provided with a letter of recommendation from our hospitable friend Mr. André Glisse, at Ooshak, to a fine old bearded Turkish merchant, Hadji Zadeh Ali Agha: we lost no time in sending it to its address, and soon had the pleasure of seeing the kindly face of the gentleman of the long robe himself, accompanied by a Greek merchant of the name of Kutchuk Yanaco, Little John, who took us to his house, gave us an excellent dinner, and treated us with the generous hospitality of which the dwellers of the interior of Asia Minor may so justly boast. Walking about the town, we saw a marble sarcophagus with its cover bearing an inscription in which is the name of the person whose remains it once contained. It is now used as a trough for a public fountain. We likewise saw at the door of a public bath two lions holding the heads of bulls. As I believe Koola is not built upon the site of any ancient city, these must have been brought from the neighbourhood, where there were many towns in the olden times. The position of Koola (2412 feet) is much

higher than the Hermus, which passes round to the north of it.

Town and Volcano of Kooln, with public Well.

We left Koola at 3.15. The soil is quite sandy, but seems abundantly to remunerate the labour of cultivation. After twenty minutes' ride came to a well, where we stopped to water our horses. I took here the accompanying sketch of the town; but the greater part of it is out of sight, the banks of lava standing as a high wall in the foreground, so as almost completely to conceal it. The extinct volcano appears to fill the centre of the picture, while a black stream of lava runs down its side toward the left, and then advances again to the front and right. There are no

fountains at Koola; the water is all obtained from wells, and is drawn up in an iron bucket, attached by a chain to a long pole, which has a weight at the other end. A small platform is built of stone round the mouth of the well, whose worn edges attest its age and usefulness. I have taken this opportunity to delineate our party, not forgetting our faithful dog Ira, who has rendered herself very useful all the way in assisting to provide for our table during the day, and keeping faithful watch at night. I have only left out our pack-horses and the mare and her colt.

Here we were joined by the mounted guard which the Governor had provided for our safety. We accepted the proffered escort; not that we placed the slightest reliance upon such people in case of danger, but solely because no one in our party was acquainted with the road as far as Cassaba. There is, however, this additional motive for taking such people along when travelling in the country: in case of meeting robbers and suffering loss by them, the Government officers succeed in throwing off all responsibility, unless it can be made to appear that this precaution, which they always recommend, has been taken; and even then it often occurs that the robbers have partners in the Mejlis, or Provisional Council. The ground now gradually rises, and we had, further on, an excellent view of the city, with its volcano and stream of lava flowing from it to the town, which appears, indeed, to have been built in great measure in the midst of and upon the lava.

The pieces of this mineral which we picked up were very porous and light, but extremely hard. Even the hammer produced no impression upon them. Found a small extent of surface where the rock in place was limestone, with impressions of shells. This was the last of the formation traced all along from Ooshak; for we now were fully landed upon the mica slate, which no longer appeared only occasionally and in a decomposed condition, but was everywhere about us, and under our feet, in rocky ledges of every shape. The highest ground appeared to be covered with a layer of lava. When we reached the greatest elevation on the road, we had a fine view of another extinct volcano, called in Turkish *Kara Devlit*, or the Black Inkstand, a very

Volcano of Kara Devlit.

appropriate name indeed, as can be seen from the accompanying sketch, taken from this spot. It stands near the edge of the plain or valley through which

flows the Hermus, not here in sight. It must be very high, as I judged that we could see but about one-half of the whole, rising above the hills that hide its base. It appears to have been thrown up entire from the bowels of the earth, and to be wholly formed of lava and scorise. The crater itself is well marked, and many trees, apparently pines, grow upon the edge and outer surface, whose fresh green colour makes a strange and striking contrast with the black hill on which they stand. Here we entered into a deep cut in the rock, and came, at 4.45, to a guard-house, built in the side of this cut, and thus protected from the extremely cold blasts which must sweep over the spot, whose elevation cannot be short of 3000 feet. We presently again descended, and travelled over level ground, passing by many neglected orchards and fields; there was probably some village out of sight in the neighbourhood. The west wind now freshened, and we reached, at 6, the isolated café situated at the head of the well-known Cavak Dereh Pass, in a bleak spot, fully exposed to the blast, and extremely cold and uncomfortable. But there is no other stopping place for the traveller between Koola and the village of Salihly; the accommodations afforded consist of two miserable rooms and a large stable, beasts being really better provided for than men. I did not wonder, except for the cold, which was piercing, that a large caravan preferred to encamp in the open air. This spot is 2681 feet above the sea. It constitutes the very edge of

the plateau which occupies the most of the Peninsula of Asia Minor. We shall now descend to the low alluvial plains which form a belt between the plateau and the sea.

*Friday, Sept. 2nd.*—We started at 5:30, and plunged at once down the rocky pass of Cavak Dereh, or Poplar Pass, a very inappropriate name, since there is not a single poplar in it. Our lodgings were not only very uncomfortable, but we paid very dear for all we took, as it had to be sent for to a village half an hour off. The wind had fallen, but mists floated about us, and the sky was overcast. Cavak Dereh is a steep and rocky gorge, consisting on a great measure of the bed of a stream; it is two hours or some eight miles in length. We passed as many as four dried-up fountains, which had once been erected for the comfort of the traveller, who must greatly depend upon a refreshing draught while going up this pass in a warm summer's day. We are here in the midst of the mica slate formation, which has, however, a hard texture, and contains a smaller proportion of mica than yesterday. Emerging from the pass, we came to hills of earth, where the road was smooth and good. We soon caught sight of the plain of Philadelphia on our left, watered by a tributary of the Hermus, called the Kooza Chay, or river. It is bounded on the south by the mountain-chain of Tmolus, which has different names in different localities. It commences a little south of Philadelphia, where a chain of hills running due south joins it to the Messogis

of the ancients, the southern boundary of the plain of the Cayster. The Tmolus runs west in a slightly curved line, nearly as far as Voorla, the ancient Clazomene, where two prominent conical peaks give it the name of the Two Brothers. The group of hills attached to these are the ancient Mount Corax. Thence, eastward, a line of porphyritic hills runs past Smyrna on the south, and reaches the western extremity of Tmolus himself, where it is called Tahtaly, or the mountain of planks, from the fact that the pines are there cut into boards and taken to Smyrna for sale. It is now, however, mostly barren of trees in this portion, and a line of hills running north unites it to Sipylus. Tmolus, a little farther east, is called Nif Dag, from the village of Nif, or Nymphio, at its foot; the remaining portion, the highest of all, and still farther east, goes by the name of Booz Dag, the ice-mountain. Tmolus does not, however, in these parts, come right down upon the smooth alluvial plain, but is separated from it by a belt of earthy hills, chiefly of a reddish hue, which have been so worn by the rains and tumbled about by the earthquakes of the "Katakekaumene" as to assume all sorts of fantastic shapes. From our commanding position we could distinguish several towns in the plain; Derasily was upon the edge of it, right before us, and Salihly, a place of considerable size, beyond it, not far from the opposite edge. The Binbir Tepeh, thousand and one hills, the pyramidal tombs of ancient Sardis, covered a vast extent of ground on the right, and behind

them rose blue old Sipylus, round and rocky. We reached Derasily at 9; the road constantly descending, and most of it in good condition, we had made 5 hours in  $3\frac{1}{2}$ . Had a luncheon of fruit, grapes and an excellent water-melon, at the miserable khan, and were off again at 9:45. This village, like all the rest in the region, is marked by misery, poverty, and dilapidation. It is, however, surrounded by rich soil, which would secure it wealth under a different Government. We had already entered the plain, and were soon upon the low grounds, always wet in winter, and now grown over with a thick, rank grass. We reached the Kooza Chay at 10:30, and found it nearly dry; there was just water enough in it to make the flow to the north-west perceptible. The banks are here from six to eight feet high, and about seventy yards apart. The stream is not fordable in winter, and has to be crossed by a bridge, situated a little below. The left bank is also covered with rank grass, and the soil near the river very sandy. We, however, soon came upon cultivated fields, whence crops of grain had been gathered. Saw several threshing-floors; noticed several plantations of poplars; these are sown thick, and are thinned out as they grow; they are used for building purposes. At 11:15 reached Salihly; it must be a bad place for intermittent fever, for even now pools of water are standing in the very town, swamps can be seen all around, and the rich plantations have abundant clusters of reeds which always indicate the presence of

stagnant moisture. There are many trees about, and extensive orchards; the land is under cultivation all around to the mountains, as far as the eye can reach, and much of it appears to produce melons and maize, which require the richest soil. The place seems prosperous; several houses were building.

We took up our quarters in the best khan in the place; it consists, as usual, of an inner square court, surrounded by buildings. In this case two sides were occupied by stables, and the two others contained rooms, the side upon the street, alone, being two stories high. The whole, like all the houses we saw in this place, is built of mud bricks supported by a wooden frame. They gave us their best room, situated on the left side of the entrance, and we had from the window a full view of a group of the *élite* of the town, who come, in the afternoon, to sit on little stools under the shade of the trees, smoke their *nar-guiles*, and sip their coffee, while some one in the company volunteers to make them stare by relating the most extravagant pieces of information, followed by a general discussion on politics, and a passing of judgment upon the doings of the great powers of Europe and the little power of Turkey. We enjoyed a doze in the midst of the hum of voices—if enjoyment it may be called, when mosquitoes and other tenants seemed to consider us as intruders. The room was ornamented with paintings *al fresco*, which are as fair specimens of the present condition of the fine arts in Turkey as can be met with. As

my narrative claims to contain a true portraiture of the Turkey of the present day, I must not deny the reader the pleasure of gazing upon a specimen of the kind, the handsomest modern *tableau* I have met, which covered one side of our room. My copy is a faithful reproduction, though I confess that the beauty of the original is greatly enhanced by the gorgeous colours the Oriental artist has succeeded in applying with wonderful variety.

Specimen of Turkish Painting.

*Sept. 3rd, Saturday.*—An observation taken this morning at half-past four gives the position of Salihly at 417 feet above the sea, showing that we have descended 2276 feet since our last stopping place; it must be about the difference of altitude between the head of the pass at Yedi Kaleh Caiveh and Derasily at the foot, the distance between them by the road being about twenty miles. Salihly is not fifty feet higher than the Hermus. Our road took us not far from the edge of the plain, upon smooth and well-cultivated

ground. After a while, Carabed discovered he had left his overcoat behind, and went back to fetch it; he found the Khanji had already appropriated it and was wearing it with great *gusto*. The road still kept in a curve near the foot of the hills, avoiding the lower level of the plain which is probably under water during the winter. After a ride of an hour and a quarter we reached the ruins of Sardis, mostly situated on the left of the road. The citadel, rendered so famous by the history of ages preceding the Roman conquest, was built upon a high and steep hill; earthquakes, and the action of the weather upon the soil, which contains no rocks, have gradually torn it down; only a small piece of wall yet stands erect upon the edge of the precipice to tell of its former power, and even that may suddenly disappear. The town lay around three sides of the castle-hill, north, west, and south. On the higher portion are the remains which are called "the house of Cræsus." We only saw it from the road, and it seems more like a theatre; the lower portions appeared to be supported by very solid arches.\* There is on the east a wall of no great solidity running up the hill. It may have been a portion of the city wall. Lower down are the remains of a large building, mostly of bricks, which appears Roman; and lower still are those of another very large edifice, consisting of four solid pilasters of

\* A subsequent visit enabled me to ascertain that these buildings were the theatre and stadium. The so-called "house of Cræsus" stood much lower down the hill.

marble beneath and brick above, the marble facings having probably fallen from the upper part. Half a mile to the west are the remains of another, a very massive building, partly of brick and partly of marble. The ruins of the famous Temple of Cybele are on the south side of the hill, as we were told, and distant from us six or eight miles. We continued to skirt the edge of the plain as we proceeded on our way, but now passed over undulating and stony ground, formed by the débris of the mountain. At 8·30 reached a café, with a shop, well shaded by trees, which were a great attraction to the traveller on a hot summer day. There was here again a plantation of poplar trees, such as we had seen about Salihly. We had also spied two fine cypresses a little back. This tree is not found upon the plateau, except where it occurs wild and stunted upon some of the high mountain ranges. We found the same to be the case with the fig-tree, which we first saw at Salihly, covered with un-ripe fruit; however, the ripe fruit was sold in the market. We found the fig-tree here again, and it multiplies as we advance toward the sea. This tree sometimes occurs upon the lower parts of the plateau, but is stunted, and the fruit is not good. We left the pleasant shade of this spot at 9·15; the whole distance from Salihly to Cassaba is eight hours, and this café, called Ahmedly, is the half-way place. Carabel was again oblivious, a very unusual thing for the bright fellow, for he forgot the barometer at the café, and we waited

half an hour for him to turn back for it. As we approached Cassaba, the miserable mud houses of the town and the minarets began to peer among the foliage, while the lofty Sipylus, of a deep blue, rose apparently right behind the town, though it lies really at a distance of fifteen miles. We reached the place at 12:50. Though showing an advance in civilization to one who comes from the Interior, it has the reputation of being a dirty and unhealthy place of residence. The streets, though narrow, as in Turkey generally, have side walks on both sides of them, and between these runs a continuous dark stream of dirty water. The town is certainly highly favoured in both the quantity and the quality of its water, and artificial fountains are met with on every side. But the water runs off upon the surface, there being no sewers to convey it out of sight. Moreover the people are constantly throwing every species of offal and filth into it. They have another very dirty custom: instead of repairing the pipes which convey the water to the town and distribute it to the fountains, they frequently throw dung into them, in order to prevent their leaking. Surely a sanitary committee is loudly called for at Cassaba.

The water-supply of the town comes from a very fine and abundant spring, some two or three miles distant. It flows through an aqueduct about 40 feet below the ground, with openings for ventilation every 200 yards. It is evidently an ancient work, of remarkable solidity. Time will, however, destroy the most solid works of

men, and this aqueduct has broken down in some places, and leaks in many more. The Turks have no provision for repairing public works; it is one of the beauties of the Muslem faith that such deeds are great acts of virtue, which will meet with special rewards in heaven. It has therefore either been taken for granted that such things would be attended to, or else fear has been entertained that any public provision would take away the merit of those charitable deeds; and it is well known that every public building or work is going to ruin in this land. Once in a long period a man who has amassed riches by murder and rapine will, under the influence of some twinges of conscience, leave a few "purses" to repair an old bridge, or to bring water into a long dried-up fountain. But these may truly be regarded as rare exceptions to the general rule. And so it is that at Cassaba the Roman aqueduct, instead of being repaired, is filled with dung to keep it from leaking. Offers have been made by European engineers to make the repairs, but the Government refuse to provide the funds. The water is remarkably fine and pure near the spring, and many people go there to fetch their store of it; but by the time it reaches the town through the aqueduct it becomes a dark-coloured and filthy fluid, quite unfit to be used as a beverage.\*

\* The ravages of the cholera were fearful and unprecedented at Cassaba in 1865, a year after our visit, which is sufficiently explained by the above description of the water supply. Who is responsible for this dreadful mortality?

The buildings of this place, though generally of mud, show a decided advance in civilization. They are often plastered and painted, especially the side towards the street; the roofs are uniformly covered with tiles, and we meet here the Turkish *chaknisy*, a portion of the upper story projecting several feet into the street. Despite all the disfavour which this fashion meets with, especially on account of its favouring the spread of a conflagration, there is no doubt that it is a great comfort in the summer season. The end windows receive the breeze which always flows up and down the narrow streets and diffuse it through the house; not only adding much to the comfort of the inmates, but also rendering the habitation more healthy. Cassaba evidently takes its pattern from Smyrna, but it calls to mind what Smyrna was thirty years ago. The Greek language appears to be generally spoken; and as we walked about the place, we noticed that the men and women of that nation dress very much as in Smyrna. The elder women, however, very generally wear full trowsers and a jacket, while the younger and the girls use the gown; this would indicate that a few years ago the Turkish dress was still in use. Here the Rayah women drop the veil, which they are obliged strictly to adhere to through all the Interior.

We took a room in the best khan, a large structure of wood and mud bricks, consisting of an inner court with central fountain, surrounded by two stories; stables and offices below, and lodging-rooms above. We occu-

pied the corner room up-stairs, and had a good view of two streets. Our furniture was fine in comparison to anything the Interior had offered us—a sofa, rude table, stool, and rickety chair. Looking about us and taking a stroll, we noticed that fig and pomegranate-trees were abundant, and covered with fruit. One cannot visit Cassaba in the warmer season of the year without being struck with the immense number of storks. They are perched, and have their nests, upon nearly every chimney and house-top, and are flying about in all directions, and “tak-tak”-ing with their bills almost incessantly. They walk about in the streets and courts, and pick up their food among dogs and men, with as much unconcern as would be shown by a chicken or a turkey; we had seen the same thing at Toorkhal and Afion Karahissar. The great marshy plain below doubtless affords them an abundant feeding-ground, and all the natives are compelled, by the bigoted hospitality of the Muslem, to leave them in undisturbed possession of the upper portions of their premises. Such hospitality, however, is not always well rewarded, for the stork has been known not unfrequently to introduce snakes into the house. The same superstitious feeling has also protected the ring or turtle-dove in Cassaba, whose cooing and fluttering is heard on every side. This bird is only found in towns; I have not seen any upon the plateau, nor on the northern shores of the Peninsula, though they are found to some extent in Constantinople; they are very

bold in the Turkish quarters of the towns, where they are never molested. They prefer somewhat wet and shady spots; there is one at this moment walking and feeding right under the window where I sit, unmindful of passers by. They are called "*dhekokhtooras*" in Greek, which means *eighteen*, a good imitation of their cry, for which, however, the Greeks endeavour to give an explanation, by saying that they represent an unfortunate daughter-in-law, whose mother quarrelled with her about some loaves of bread from which one was missing. The poor daughter kept asserting that eighteen was the number, not nineteen, that had been baked. To release her from her life of torment and abuse she was transformed into a ring-dove, and thus is heard ever and anon to reiterate the disputed assertion, "*It was eighteen, eighteen!*" (δέκα ὀκτώ.) Would that the hospitality of the Turks were confined to storks, "*eighteens*," and dogs. They have their uses, and form a part of the economy of nature in this country, of which one broken link would doubtless cause the whole chain to give way. But when it comes to certain blood-suckers which patronise not the street, and the house-top or chimney, but the interior of the habitation itself, it becomes a question as to who shall vacate the premises! I remember well how at Constantinople Sultan Abdool Mijid removed one day from his winter palace of Cheragan to his summer palace of Beïlerbey, without previously asking leave of the already-admitted tenants; and he, therefore,

the very next morning moved back again from Beilerbey to Cheragan. Bed-bugs were too powerful even for his Highness the Sultan. I have been assured that he never again stopped at Beilerbey, at least through the *night*, until the whole palace was *accidentally* burned down to the ground.

Noticed a great abundance of laurel or oleander bushes between Cassaba and the banks of the Hermus. There are yet many crimson flowers upon them. The first we had seen from the moment we set foot on shore at Samsoon and throughout our land journey, were met with between Salihly and Cassaba.

*September 4th, Sunday.*—The elevation of Cassaba (434 feet) indicates a rise of ground of 27 feet above Salihly. This town is supported by agriculture and the raising of silk-worms. It commands a great extent of fertile land on both banks of the Hermus; and there, among other products, are grown the famous Cassaba melons, which are carried in such quantities to Smyrna, and are even offered for sale at Constantinople since the introduction of steam communication. Cotton is also an important staple, and all the usual grains are grown with advantage. The higher grounds are planted with vineyards. A large surface is also covered with gardens and mulberry plantations; but though cocoons are raised here in abundance, there is no local manufacture; they are all exported. The introduction of such branches of industry by the natives themselves is effectually prevented by the system of

robbing and extortion carried on by Government officials and Turks in authority, added to the impossibility of the Rayahs (the only class which possesses the requisite qualities for engaging in manufactures) obtaining redress in the courts—chiefly because their testimony is not received against a Muslem. The only manufactures that have succeeded in this country are carried on by foreigners, and they maintain their position only by the ever watchful protection of their respective Governments.

*Monday, September 5th.*—Rose at 2 A.M., and started at 4. A man led us with a lantern through the town, and it began to dawn some time after we had put our horses to their paces upon the high road. The morning was quite cool, a fresh breeze blowing from Tahtali on our left. The ground was at first sandy and pebbly, and we were told that this part is often under water during the winter, compelling the traveller to follow a more circuitous road nearer the mountain. Lines of laurel bushes closed the view of the plain on our right. At 5.45 came to a café among clusters of trees, and we soon after reached the Nif Chay, a very considerable stream, which rises in the mountain of Tahtali, and flows to the Hermus. The water is now very low; the stream meanders and turns so many times in the narrow but beautifully-shaded valley, that we had to cross it five times; the last time was by the side of a stone bridge, of which four arches alone are standing, several others having been carried away. The banks

of this river abound with the platanus or plane-trees, of remarkable size and beauty; the oleander grows luxuriantly in clusters, and trees of different species form bowers and groves in every direction. Nightingales must be very abundant here in the spring, for this is just the kind of place they like best to frequent. The mountain is so near that the river fills its bed and becomes unfordable after a heavy rain, and travellers are compelled to follow a path upon the slope of Sipylus on the north side of the valley, and to cross the Nif Chay at a bridge situated lower down. This valley is famous for highway robberies; for the thick clusters of trees and bushes enable the bandits to hide wherever they like, and to shoot down the traveller as he crosses the stream. Nymphio, which gives its name to this river, is situated on the left, at the foot of Tahtali Mountain; and all the land between it and the Nif Chay is green with orchards and fruit-trees, where are gathered, among others, the celebrated Nymphio cherries. We soon came out of this fertile and delicious valley, and passed into another, which shortly became as remarkable for its excessive aridity, being stony, dry, and at last wholly destitute of verdure. The white limestone rocks were not only hard to travel upon, but they reflected the burning rays of the sun with such intensity as to be even painful to the eye. Our poor horses dragged themselves wearily through this pass as we went along the inhospitable slopes of Sipylus. We reached the miserable hut

dignified with the name of *café*, but well characterized as Tash *café*, the *rock café*, at 9·30. It lies just before the entrance to the cut or narrow gorge that leads out into the plain of Smyrna. We went up this pass, and found most of it only a few feet in width, with steep banks on both sides. It is paved throughout, though the pavement is in a ruinous condition. As we rode through we could not avoid reflecting upon its eventful history. We here met some machinery, dragged along upon wooden rollers; it was intended for a cotton-cleaning factory, about to be set up by a European in Cassaba. Descending from the highest point upon the road, which was still hemmed in by high banks, effectually closing up the prospect, we reached Bell *café* at 10·15, and suddenly emerged upon a small platform, whence we had a complete view of the whole plain and gulf of Smyrna, the two lines of mountains on the right and left running parallel to the west, while the space between them in the foreground was occupied by a level and fertile plain studded with villages;—the turreted hill of Pagus, some distance off in the line of hills on the left, with the town of Smyrna starting from its base and spreading almost across the picture, the old windmill upon the point of land ending the line of buildings on the north,—then the dear blue sea, the old familiar outline of the “Two Brothers,” and the sea-castle beneath them, and far, far off in dim outline, our old friend the weather-gauge, hoary old Carabournoo, the mountain

and cape which closes the gulf on the west. We stood still a moment in amazement at the splendid panorama, the sense of the beautiful and the love of "home" conspiring to fill us with enthusiasm, and we all spontaneously gave a shout of recognition and a hearty cheer. I am sure the Turks and Greeks about us must have wondered where we came from, to be so much excited by the sight of the old place. We could scarcely bring ourselves to rest here through the warmest part of the day, in order to refresh both man and beast. We waited some time, however, before our horses came up, for we had unconsciously pushed forward at a rapid pace. The spot was truly beautiful. The pass behind us can be seen from quite a distance at sea, appearing like a deep indentation in the chain or wall of hills which rises at the end of the valley between Tahtali and Sipylus. It is, indeed, one of the land-marks by which vessels are steered into the port of Smyrna. Cultivation begins at the Bell Café, and gives freshness to the little valleys which lead down to the plain, while the summits of the mica and limestone hills are barren and rocky. The café with its stable is well shaded by a clump of plane-trees, and there are ruins of other huts. We rested here until 2 P.M., when we started down the steep hill over a paved road, which is sadly out of repair. The weather would have been oppressive but for the fine sea breeze, here called the *Imbat*, blowing right in our faces. The wind had been from the south-east,

Distant view of Suwayna and its Gulf.

and the air was charged with hot vapours; we saw the westerly breeze coming long before we felt it, by the sails of the boats in the gulf. Passed on through plantations of olives and pomegranates, with the village of Narlikeuy on the right, which derives its name from this latter tree; and at 3 o'clock arrived at a café which lies opposite to Boornabat, on the south side of the plain; this is called one hour from the city. Rode by the spring, a little sheet of water, shaded by an ancient platanus, which is known as "Diana's Bath," now turning a flour-mill. Here, instead of continuing on the straight road to Smyrna, we turned into a stony side lane, which took us to the Booja road, on the edge of the lacustrine formation, and thus under the walls of ancient Smyrna, through the gap well known among the natives by the name of Kara Kapoo, the Black Gate. We had from this spot a fine view of the plain, which is traversed by the Aidin Railway, with Sedikeuy at the foot of Mount Corax. And thus following our old beaten track over the plain by the "white mountain," and through "the paths among the vineyards," we were brought by God's good providence in safety to the dear summer home at Sedikeuy, which we had been approaching ever since we started from Tocat on our overland journey, forty-one days before.

## CHAPTER XXVII.

Visit to the Statue of Niobe—Region of Mount Sipylus—Valley of Nymphio; abode of the “Divine Nymphs”—Distant view of the stone image—Erroneous impressions of travellers concerning it—Appearance of the statue on a close view—Dimensions and description—The “tears of Niobe”—Tradition respecting the Statue—Evidence of ancient writers—Suggested explanation—Agreement with the Greek legend—Visit to the Monument of Sesostris—Difficult ascent—Herodotus' description—Return to Nymphio—Unsuccessful attempt at exaction—Palace of the Byzantine Emperors.

IT had been our intention, before ending the long overland journey described in the foregoing pages, to visit two of the most interesting monuments of antiquity, and probably the very oldest to be found on the Peninsula. But, though these lay not far off our road, we were naturally anxious to reach home, and, as they were near Smyrna, we easily persuaded ourselves to put off our visit to a later period. I refer to the Bust of Niobe upon the eastern extremity of Mount Sipylus, and to the Monument of Sesostris, near the northern entrance of the pass through Tmolus, from the plains of the Hermus to those of the Cayster. The last of these is recognised and accepted by all; but it is difficult of access, and few venture upon the

undertaking of paying it a visit, though such trouble is rarely better rewarded. But there has been so much misapprehension and misrepresentation respecting the Bust of Niobe, and it is yet so remarkable a monument, that the reader will doubtless thank me for minutely describing it.

But first, a few introductory words respecting the general features of this region.

The Gulf of Smyrna, which lies about the middle of the western coast of Asia Minor, is formed by two ranges of hills, running east and west some 3 to 5 miles apart; near their western extremity another mountain, the ancient Mimas, running north and south, closes up the mouth, leaving, however, a broad entrance at the north-west corner. The two parallel lines of hills of which we have spoken rise higher as they tend eastward, and the southern one becomes Mount Tmolus, while the northern is Mount Sipylus. There is what may be called a bridge of hills thrown across from Tmolus to Sipylus, thus completing the enclosure wherein lies the Gulf of Smyrna. Smyrna itself is built at the foot of a hill, called Mount Pagus, on the south side of the enclosure, and from the city to the eastern hills the water of the Gulf has been displaced by low alluvial land, which is covered with gardens, vineyards, and olive-groves, and studded with prosperous villages. The rich valley of Nif, or Nymphio, has already been described as of surpassing loveliness and beauty in its central portions, though surrounded

by arid and barren cliffs. It is watered by the Nif Chay, which flows out of the sides of Tmolus. And the place was, doubtless, as attractive for its natural beauties in ancient times as it now is; for the Byzantine emperors had a palace here, erected by the younger Andronicus, whither they retired from the cares of state.

Old Homer, in describing the Statue of Niobe on Mount Sipylus, thus portrays the locality (we use a literal translation, as Pope's does not faithfully render the original). He says:—

“And now among the rocks and solitary cliffs of Sipylus, where they say are the couches of the Divine Nymphs, who dance upon the banks of Acheloüs, she [Niobe] though turned to stone, still broods upon the pains inflicted by the gods.”—(‘Il.,’ xxiv. 614.)

There is not in all the surroundings of Mount Sipylus any place more likely to have been the reputed resort of the “Divine Nymphs,” who retired to their couches in the adjoining cliffs, than this valley of Nymphio. The Nif Chay also answers to the description of the Acheloüs, rising as it does in the side of Mount Tmolus, and flowing past Sipylus to the Hermus. And the name of Nymphio, a corruption, no doubt, of *Νυμφαῖον*, the abode of the Nymphs, shortened to Nif by the barbarian Turks, is an additional evidence that this was indeed the spot described by Homer. It is a very ancient place, as may be seen from the remains of a bath and a castle on the hill, and history has never given it any other

name. All these circumstances lead us to the conclusion that we have the Acheloüs in the present Nif Chay, and that the valley of Nymphio is the reputed abode of the ancient Nymphs. The statue of Niobe cannot, therefore, be far away. We now proceed with the narrative of our first visit to the very ancient statue, which the people of the country have always agreed to call Niobe, but which all travellers—Chishell, Arundel, Strickland, Hamilton, Texier, and many more—consider to be either a statue of Cybele, the mother of the gods, or a monument of some departed hero.

There is now a railway from Smyrna to Magnesia, a large and important town on the north side of Mount Sipylus, occupying a recess where a prominent and steep hill is crowned with the remains of its ancient fortress or castle. It was an autumn day, and we had ridden in the cars, reaching Magnesia in about two hours after leaving Smyrna, the distance traversed by the road being about 40 miles, winding round the head of the gulf to Menemen, and following thence the course of the Hermus. The road that leads from Magnesia to Nymphio, or more directly eastward to Cassaba, Sardis, and Philadelphia, is the ancient road of the world's conquerors from Sesostris to Timoorlenk (Tamerlane), and skirts the plain at the foot of Mount Sipylus. As you proceed the mountain rises more and more abruptly from the plain, which is fertile and well cultivated; vineyards, mulberry plantations, and fields of grain, extend

to the distant hills, and hide the course of the Hermus, which flows from east to west about 2 miles on our left. I passed over this road in a rough cart on four wheels, without springs, drawn by two miserable horses, whose harness was made of untanned leather and ropes, and driven by a Crimean Tartar. Our course was between the mountain and the continuation of the railway from Magnesia eastward to Cassaba.

After riding about three-quarters of an hour, we crossed a mill-run by a little bridge. This small canal is dug out of the mountain side, and is solidly built up with stones and cemented with lime. It extends to a distance of 500 yards, to where it is crossed again by another bridge, and is a far more solid structure than we generally see in the country. A good part of the way, a paved road for carriages, now out of repair, lies beside it. The water it conveys flows westward toward the plain, and is employed in working a flour-mill. Following this canal for about 100 yards, after passing the last bridge, we came to a miserable café, on the left of the road, built by the edge of a pretty pond, which supplies the canal or mill-run. This sheet of water is 300 yards long, and about 50 wide, stretching along the edge of the mountain, from which it is separated only by the road. It is replenished by four springs issuing from the ground upon its brink, and there are others, it is said, beneath the water. This pond is evidently artificial, being formed by an ancient

wall of solid blocks of stone, which retains the water on the side toward the plain.

We have described this spot so minutely, because some very learned men have thought it was once the site of a whole city which was swallowed up by an earthquake. Its small size is quite against this supposition.

We now go back to the narrative of our visit to this spot. When about 150 yards from the café, our driver called out, "Here is the Tash Suret!" (stone image). Looking up we saw what appeared to be a woman's rude form carved out of the rock; the arid and barren limestone, which had hitherto formed the higher portions of the mountain, here gradually descends nearer the plain, offering a ledge often quite perpendicular. Where it faces the north-east it is particularly smooth, and the figure appeared to be carved in relief upon its surface. There is an indistinctness from below especially, because the sun can light it up only early in the morning, which accounts for the fact that some people have thought it only a freak of nature, and would not take the trouble to go up and examine it. The image is colossal; from below I received the impression that it represents a woman in long robes, reaching to her feet, whose folds seemed very distinctly marked. This is the idea adopted by travelers who have written upon the subject. Had they gone up they would have seen that the statue consists simply of a *bust* set upon a pedestal, and that

what they took for folds of a robe are *Niobe's tears*, trickling down from her face to the bottom of the monument. Some travellers, however, have thought the statue "represents a woman in a sitting posture, and in *an attitude of contemplation*;" and Stewart actually gives us a picture of the woman thus *sitting, and with her arms folded upon her breast!*

I hastened to the café, and on inquiring about the best path to ascend the mountain, learnt that a Greek who stood by the roadside, and sold *yevrekia* (cakes) to the passing camel drivers, is the *cicerone* of the statue. I therefore set him before me, and began a steep and fatiguing ascent, made somewhat dangerous by the loose stones over which we had to pass.

The ascent begins at the road; I could see the interesting object of my visit at a high angle up the mountain, right over the pond already described. We followed a zigzag course, first upon soil cut up by the winter rains, and then over pieces of hard limestone which had fallen from above. We finally reached a small platform of earth, by the side of a large rock standing apart from the main body, and probably fallen from it; I had, from this point, a very good view of the statue, in some respects the best. This spot does not lie in front, but a little to the left and below the statue; distance about 50 yards. I then climbed to the base of the monument; but Pausanias had truly said of it, "When standing close to it, the rock and precipice do not show to the beholder the form of a woman, weeping

Statue of Niobe.

or otherwise; but if you stand farther, you think you see a woman weeping and sad."—('Attica.' L. i. 21, 5.) Viewed close by, it appears of unnatural breadth, and such unnatural form that some have doubted whether it was intended to represent a human being at all. The "tears," too, streak it over with broad lines of blue of various shades which bewilder the mind. At a moderate distance these defects disappear, and the design of the artist is clearly perceptible. The spot most favourable for viewing it is on the right, its own left or western side. The shades there bring out the sculpture, and the desired level can be secured. The accompanying sketch was drawn from that spot. The description I shall now give of the statue is the result of the examination made, not during this visit only, but also on a subsequent occasion, when a whole party of us came to the spot with all that was requisite for taking precise measurements.

The soil stands some 12 feet below the base of the monument, and a narrow platform or artificial projection is cut out of the rock. This projection, well worn and very slippery, extends not only in front of the work, but for a considerable distance on its eastern side. From this projection to the top of the rock the height is about 50 feet, over the whole of which the surface from top to bottom has been cut smooth with the chisel for a considerable distance on both sides of the sculpture. An alcove, or niche, some 35 feet in height, and 16 feet 4 inches by measurement

in width, has been cut into the rock, and a smaller alcove, of much greater depth, surrounds the bust itself. The latter is of colossal size, representing the head, shoulders, and breast of a female, and ending a little above the waist. The arms are wanting. The work stands boldly out from the rock, being in high *alto rilievo*. The features are wholly obliterated, the marble being there completely broken off, and even dug into at the place of the right eye and cheek. Some traces of hair, unless it be the rough chiselings, are visible over the left ear, which is also gone. The bust is set upon a broad and high pedestal, upon each side of which is a shelf, perhaps for the purpose of receiving offerings. The whole work from the top of the head to the base of the pedestal measures 20 feet 8 inches, the entire bust being 8 feet  $3\frac{1}{2}$  inches in height, and 9 feet wide at the shoulders, while the height of the head is 4 feet 2 inches. The two shelves stand 7 feet  $1\frac{1}{2}$  inches from the bottom. But the characteristic feature of this sculpture, that which enables us to identify it as the bust of Niobe, consists in the "flood of tears" which incessantly pour down from her face to the base of the monument. The appearance is remarkable and striking. The stone here is of white marble, slightly tinged with red. The general face of the rock, however, affected by the influence of the atmosphere, is blue; the two alcoves are white, as is the whole carved work. But from the eyes, and especially from the right eye, a

dark blue vein descends over the lower part of the face, drops upon the breast, falls upon the pedestal, and flows thence in two broad streams down to the foot. The first time I examined this monument it seemed to me that these blue veins were portions of the rock of which the artist had availed himself in order to represent the tears of Niobe; they were hard and dry, and on being cut with an iron tool presented every appearance of a blue vein. But, upon a later visit, I found that it had just rained, and the water was yet dripping from the ledge overhead to Niobe's face, and actually flowing down the face of the sculpture, imparting to these veins a much deeper hue. They had also been softened by the moisture, and could be broken off with a sharp tool. My conclusion, therefore, was, that the water trickles down the rock so as to strike upon the face of the bust, and leaving a blueish lime deposit wherever it passes, represents a flood of tears pouring down the monument.

My cicerone informed me that, since the opening of the Smyrna, Magnesia, and Cassaba Railway, many visitors come to this spot; and, said he, the English stand at the outer rock, and fire with ball at the face of the statue! The story appeared incredible, for it seemed more likely that the Turks would commit such an act of Vandalism; but he assured me that it was so, and that he had himself repeatedly seen the English do it. The only motive I can imagine is the English

passion for a small bit of everything they see abroad to carry home and show to their friends. I had ocular demonstration of the number of visitors who now come to the spot in the many initials rudely scratched upon the accessible portions of the work. I could perceive no trace of any buildings connected with this sculpture; but they may have been obliterated by time. There are several tombs cut in the rock near by.

The view from this spot is extensive and fine; the great plain stretches to the horizon, and not far below us meet three celebrated streams, the Gediz or Hermus, the Nif Chay, Homer's Acheloüs, and the Koom Chay, "the fishy Hylus" (another of Homer's appropriate epithets). The plain is narrowest to the N.E., the hills of Kara Dagħ coming forward in this place; but in every other direction it presents an unbroken mass of verdure which melts into the distant mountains.

Standing at the base of this ancient monument, some 400 feet above the plain, I looked right down into the little lake I have described. Can any one doubt, I thought, that Homer's mind turned to this spot, and that this was the Niobe who, weeping though turned to stone, filled with her tears the basin beneath her feet, of whom he sang: "Upon arid Sipylus, upon the rocks of the desert mountain, . . . Niobe, though turned to stone, still broods over the sorrows the gods have sent upon her"? Such were my reflections when the

cicerone, the *yevrekji*, broke out with the following: "There is a tradition that this statue was once a woman whose children were killed, and she wept so that God changed her to stone; they say her tears made a pond down there, and still keep it full." It is indeed strange to find that all the people around here, both learned and ignorant, unite in calling this Niobe; and that all our learned European travellers, on the other hand, should agree in denying it. For my own part, I think tradition is right this time, and that the learned are wrong. I find by comparing their accounts with the statue itself, that they contain an astonishing amount of mistakes. One learned author says the statue lies 100 feet from the road, and another, equally authentic, makes it 65 feet. For my own part I am satisfied that this statue is old Niobe, one of the most ancient sculptures in existence; for it stood there in Homer's day. Others, after him, have thought the work worthy of their pen. Pausanias goes out of his way to tell us that he had seen Niobe herself when he went up the Mountain Sipylus. Strabo connects Niobe with the "Cirbesian pond," answering to the one we have described. And Ovid, speaking with still greater precision, says:—

"She weeps still, and, borne by the hurricane of a mighty  
wind,  
She is swept to her home. There, fastened to the cliff of the  
Mount,  
She weeps, and the marble sheds tears yet even now."

*Ovid, Met. ii., 310.*

An explanation, however, may be suggested which will reconcile the two theories that this statue is Cybele, the Mother of the Gods, and that it is Niobe. It may be that this sculpture was executed in a very remote antiquity to represent a female deity, Cybele, or some form of nature worship; that the natural water-drip from the rock above upon the marble gave it from the first the same striking watermark which it still bears, maintained by the same cause; and that this appearance suggested to the lively imagination of the Greeks the whole myth of Niobe, her tears, her sorrows, her stony transformation, her perpetual weeping. The Greek word Niobe connects itself with "the pouring of water" and "the falling of snow" (*νίζω*, and *νίπτω*, and *νίφω*), so that "stony Niobe all tears" is probably but a Greek impersonation of the drip-drip of the marble rock upon the ancient rock sculpture, which thus acquired the name of Niobe, "the weeping one." It is also remarkable that the Greek myth calls the eldest son of Niobe "Sipylus," the very name of the mountain in which this statue is found. Whether this be the true explanation or not, the great point of interest is still the same, that the tradition which connects this statue with Niobe is as old as Homer, and the sculpture older still, while his mention of the "places of the Divine Nymphs" seems to mark this spot as the *locus* of some very ancient religious worship. Another very curious point arises from the notice of this sculpture by Homer. He introduces the

mention of Niobe in the speech of Achilles to Priam, when he has consented to give up the corpse of Hector to his father. He presses the aged king to take food even amidst his sorrows, "for," he says, "even Niobe was mindful of food in her deep grief, when her twelve children were destroyed;" then, narrating the legend, Achilles says again, "She therefore was mindful of food when wearied with weeping." I do not know that this pointed allusion to Niobe's unremitting care for food has ever been explained. I venture to suggest that the allusion may be to the offerings of food here made to the image by her votaries, as we have already (p. 310) noticed the shelf adapted to that purpose. Homer seems to speak (may we suppose, with the slightest touch of sarcasm?) as the priests of the image were wont to speak of its votaries: "Niobe, though ever sorrowful, is ever needing food—your offerings," &c. Such an interpretation of the passage brings to our minds the crafts of the priests of Bel and the sarcasms of Daniel.

Certainly, the whole scene around us at this moment agrees remarkably with the Grecian legend, and may be looked upon as the very birthplace of the myth of Niobe. She is the "daughter of Tantalus," over whose head, remember, the rock was always hanging ready to fall. Tantalus is nothing else than a rock hanging poised in air (*ταλαντεύω*) ever threatening to come down, an exact description of the constant disintegration of the face of the hills in this region.

Niobe, in her deep-cut alcove under the overhanging ledge of rock is "daughter of Tantalus." She is, as Cybele, the great mother—her very boast; and "her children, struck down to earth, slain by Phœbus and Diana," are the masses of rock, such as we have just passed over, that fall into the valley, separated from the cliffs by the action of the sun and rain. "They lie unburied on the plain," Homer tells us, "till on the tenth day the heavenly gods bury them;" the fallen rocks after a time break up under the influences of the weather. "Here, in these mountains of Sipylus are the couches of the divine Nymphs that dance, or stream, about Acheloüs," that is, in this hill now above us are the springs (which, indeed, we have just passed) from which flow down the streams that feed Acheloüs at our feet; Acheloüs, "the son of Sol," springing, that is, from the melting of the snows in summer. If we are right in thus interpreting the scene before us and the Homeric legend, then this most ancient statue is not an image sculptured to represent the story of Niobe, but it is itself the very original from which that story sprang. Carved in the most remote antiquity to represent, it may be, Cybele, the deity of a race that preceded the Greek immigration, the circumstances that gathered round it gave rise in the imaginative minds of the Greeks to the whole beautiful legend of Niobe, all stone and all tears, as we see her at this moment, and we here look upon a monument which was even to Homer an object of venerable and

unknown antiquity, a monument antecedent not only to history, but in some sense to mythology itself.

My visit to the Monument of Sesostris was made in the company of several very agreeable young gentlemen who desired to spend their Easter vacation in making an excursion to some of the ancient sites of greatest celebrity in the neighbourhood of Smyrna. We went together not to Nymphio alone, but, passing by Cassaba, we visited the ruins of Sardis, and the *Bin bir Tepeh*, the numerous mounds which formed the necropolis of that capital of Lydia.

I must premise that Herodotus refers to this bas-relief in the following terms: "There are in Ionia two figures of Sesostris carved on the rocks, the one (by the way) by which men come from Ephesus to Phoea, the other (by the way) by which they come from Sardis to Smyrna." I shall refer farther on to the rest of his description, which is remarkably correct, but will now observe that the other monument here referred to has not yet been discovered. It is also worthy of notice that there is a similar monument of Sesostris on the remarkable rocky ledge at the mouth of the Nahr el Kelb, the Dog River, near Beyrout, in Syria, where his later imitators have sought to immortalize themselves by leaving similar marks of their passage; so that there stand side by side the boastful inscriptions of the Egyptian, Assyrian,

and Roman conquerors, ending with Selim, Sultan of the Osmanlies.

*Monday, April 22nd.*—Rode out of Smyrna going east, and passed by "Diana's Bath," a spring which oozes out of the ground from among the roots of a lofty platanus, and feeds a pond which modern improvements have successively made a paper factory and a flour mill. A Temple of Diana and Homer's Grotto (one out of the thousand which bear his name) are claimed to have stood near by in ancient times. We passed below Kookloodja, a prosperous Greek village on our right, whose tall church steeple is a conspicuous object in all the surrounding region. At 8 we passed an old Turkish cemetery. The Turks have been gradually withdrawing from the villages of the plain to the suburbs of Smyrna, unable to resist the advance of enterprise and wealth possessed by native Christians and Europeans. This is always the case in Turkey wherever the too close oversight of European eyes prevents them from robbing people with whom they cannot enter into fair competition. Leaving the large village of Boornabat about two miles on our left, we passed through the thick groves of pomegranate trees which belong to and give its name to the village of Narlikeuy, pomegranate village, situated on the left side of the road, and beyond the groves. The village of Hadjilar (pilgrims to Mecca) lies farther on, also upon the left. After crossing an extensive plain, and traversing the narrow pass of Bell

Café over the mountain, we approached Nymphio, where the thick foliage of the orchards, gardens, and vineyards quite refreshed the eye. Just before going into the village, we saw a large oblong building of stone with regular layers of bricks, standing in a garden near the road. It is called the Palace of the Byzantine Emperors, and is said to have been erected by the younger Andronicus. Reached Nymphio at 11. It is a large village built at the entrance of a narrow gorge which runs up from the broad valley into Mount Tmolus. Looking down towards the north, the valley appears one broad mass of verdure extending to the foot of Mount Sipylus on the opposite side.

We sent to the Mudir, or Governor, to point us out lodgings, and were shown to the house of a respectable Greek gentleman, who offered us a pleasant and clean upper room, with adjoining piazza and terrace; and having partaken of some refreshment, we got into the saddle again at 12.40, and followed two tall and well-armed guards, dressed in the Zeibek style, with bare legs and high caps, from which hang a profusion of little tassels of various colours. These had been furnished us as guides by the Mudir. It was evident there were expectations of making something by the job, for he refused to give us but one guide, saying it was customary to send two. We followed a path leading along the mountain side into a valley which soon becomes narrower, and observed some very peculiar hills upon its western side, which indicate great volcanic

perturbation. It was evident as we proceeded that we were turning farther away from what must have been "the road from Sardis to Smyrna" in Herodotus' time. We expected, from Herodotus' statement, to find the monument on the sides of Sipylus, and found ourselves intently eyeing the opposite mountains to catch a distant sight of some prominent ledge which might contain the precious carvings. But we entered a gorge running south-east into the very heart of the mountain. Just before reaching this gorge, we saw a dilapidated guard-house, whose occupants expect a bakshish from the European visitors who come here to pay their respects to the Egyptian monarch: we did not call upon them now, but did so on our return. This is said to be a bad place for robberies. It is the beginning of a pass that leads across Mount Tmolus from the plain of Cassaba on the north to that of Eudemish and Baïndir on the south; and on account of its difficult and inaccessible nature, it is reported to be the retreat of the highway robbers who ply their trade upon both sides of the mountain. Crossed the stream, and proceeded along its eastern bank, where there was scarcely room enough for a path. The sides of the gorge are rocky and steep, and the bed of the river is filled with fallen fragments. The rock is a red conglomerate, with hard limestone upon the top. There are many pine trees, and the underbrush is tall and full. At 2-10 our guides stopped under a tall pine, and pointing up hill to the left, told us that the

object of our search lay in that direction, among the trees and shrubs. We immediately began to ascend the steep hill side, amidst an abundant vegetation. We could see around us outcropping portions of the red conglomerate. Having risen to about 100 feet from the river bank, we found ourselves suddenly ushered into the presence of the old king, panting and wet with the perspiration of our difficult ascent under a burning sun. There he was, standing as firm and unmoved as though he were still master of sea and land from the Euxine to the sources of the Nile. The carvings occur upon a hillock whose entire height above the river is about 150 feet. The lower part of it is of conglomerate, but the top is a piece of hard limestone of pretty regular shape. The face of this rock is smoothed down over a surface 45 feet high and 60 feet broad, which fronts up the stream, or south. Were all the trees and shrubs cut away, the carvings could not be seen from below by the river bank; one would have to proceed some distance up the stream; and supposing a royal road to have once existed through this pass, the image could be seen while travelling northward upon it. No better description can be given of it than that of Herodotus himself, which I began to quote above. I shall therefore content myself with a translation of his brief but apt account. Speaking of the two monuments of Sesostris existing in Western Asia Minor, he says: "Each of these figures represents a man four cubits and one spithame in

height (six feet and a half), holding a spear in his right hand, and a bow in the left, with the rest of his costume corresponding to these weapons, *i.e.* half Egyptian and half Ethiopian. Across his breast and from one shoulder to the other is carved an inscription in Egyptian sacred characters, saying, 'I by my shoulders gained possession of this country.'—(Herodotus, lib. ii. 106.) There appears to be an error, however, in this description, for an inspection of the picture will show that Sesostris holds the spear in his left hand, and the bow in the right. But Herodotus doubtless speaks of the beholder's right and left. The carvings upon the breast are gone, but there seem to be remains of others near the corner of the tablet, and by the side of the spear head; they, however, are too far gone to justify the exact tracings we find in some copies made by artists whose imaginations gave undue sharpness to their eyesight.

It is truly instructive to look upon a monument which has not only stood the decaying influences of thirty-three centuries, but more than this, has baffled for that space of time the human passions which have conspired to destroy it. It is an illustration of the aid rendered by remains of this nature toward establishing the statements of history as truths indisputable, and never to be shaken.

We returned by the way we had come; but a second inspection of the ground still further convinced me that the road from Sardis to Smyrna never could have

passed within three or four miles of the monument we had just visited. Herodotus, indeed, does not say "*close to the road*," nor does the word "road" occur in the original; but his expression means only that the monument is reached by this way, or lies in the district as men pass from Sardis to Smyrna.

When we returned to Nymphio and our quarters, our guides began to give themselves airs of importance, which revealed their large expectations. They came upstairs and sat where they liked, eased themselves of their shoes, took off their caps, and rummaged among their folds in a way that affected the nerves of some inexperienced ones in our company. We, for some time, endured their freedom, in order to initiate our young English and French companions into some of the mysteries of Oriental life. When I, at length, handed the high dignitaries the customary bakshish, they turned up their noses at it, threw it down indignantly, and went off with a great flourish of trumpets. Some of us concluded that they must have been of the number who had led one of the English princes to the old Egyptian king not long ago, and took us for his cousins. The next morning, while we were getting ready for an early start for Cassaba, they sent a messenger to know whether we intended to go without giving them their bakshish. We replied that we should give them nothing unless they came themselves for it. One of them then appeared for both; we gave him only his own present, which he had contemptuously thrown

away the day before, and his companion got nothing until he, too, came for it in person. We, moreover, enjoyed teasing them by assuring them that the Zeïbek dress had been prohibited by an order from the capital (which was a fact), and we added, with a wink of the eye, "We know the Pasha of Smyrna well, and see him often; he does not know that the *zabtiehs* of Nymphio dare to wear the costume of highway robbers!" They must have spent a troubled day and a restless night, poor fellows! and they probably to this hour curse the day that brought them in contact with the "mean" and stingy cousins of the Prince of Wales!

In a ramble about Nymphio we saw a carved slab over a fountain, an extremely indifferent work of the later Byzantine period. There are remains of old walls, and of a fort or castle upon the hill overlooking the place. We also visited the Palace of the Byzantine Emperors, which we found to be 71 feet in length, and  $24\frac{1}{2}$  feet in width within the walls, which are  $6\frac{1}{2}$  and  $8\frac{1}{2}$  feet in thickness. The building consisted of a vaulted lower story, with two rows of windows and two stories above. The stones have fallen from the top in such a manner as to present the appearance of rows of chimneys, the tops of several of which are crowned with storks' nests. The foundations of extensive and costly buildings have been discovered and partly uncovered in the gardens, indicating that the ancient town extended some distance in that direction.

It does not enter within my plan to describe the

remainder of this journey, my object being only to draw the reader's attention to the two remarkable monuments of Niobe and Sesostris, and explain their position and some of the illustrations they afford of the venerated writers of antiquity. Sesostris is supposed to have at one time subjected the whole of Asia Minor to his arms. I have already pointed out the decidedly Egyptian features of the sculptured remains at Euyuk, whose unfinished condition seems to indicate that their authors were driven away by the irruption of a foe, so that the opportunity of accomplishing their task never recurred. The sculpture of Sesostris, near the north end of the Karabel Pass, is another and a still clearer proof of the extension of Egyptian power in the land. The first is found in Northern Phrygia, the second in Western Lydia; and as it is probable that Sesostris moved mostly upon the land, the evidence is strong that his power once stretched to the Euxine and the Hellespont.

## APPENDIX A.

## ON THE ORTHOGRAPHY OF ORIENTAL WORDS.

THE following system of orthography has been used in writing Oriental words in the present work. It was prepared by a Committee of the Armenian Mission in Turkey, and adopted at its annual meeting about twenty years ago. It will be easily remembered by persons who are in the habit of using either English or French.

## VOWELS.

- a* is always pronounced broad, as in *father* ; in French, *bas*.  
*e* as in *met* ; like the French *fermé*.  
*i* " *sit* ; " *ici*.  
*o* " *bone* ; " *côte*.  
*u* like the French in *cruche*.  
*û* as in *but* ; and the French mute *e*, in *besoin*.  
*eu* like the French *eu*, *jou*.  
*oo* as in *room* ; and the French *ou*, *croûte*.

## CONSONANTS.

Generally as in English and French.

Instead of *c* the letter *k* is preferred for the hard, and *s* for the soft sound.

*gh* represents the Greek  $\gamma$ , and the Parisian *r*.

*g* is always hard as in *gap*, and in French *galop*.

*j* represents the same sound as in French, as *Jacques*.

*dj* is soft *g*, or the English *j*, as in *Jack*.

*h* is a slight aspirate, and *kh* a harsher one.

*sh* is sounded as in English ; in French as *ch* in *cheval*.

*ch* as in English *cheap* ; in French it is usually written *teh*.

*dh* is hard *th*, as in *this*.

*th* is always soft *th*, as in *think*.

*kh* represents the Greek  $\chi$ , and is the strongest aspirate. It has representatives both in Turkish and Armenian,  $\chi$  and  $\mu$ .

Although there are two *r*'s both in Armenian and in Turkish, we have thought it unnecessary to distinguish them, on account of their comparatively rare occurrence. We have done the same with respect to the two Turkish *a*'s and *s*'s, and the two Armenian *t*'s.

In order to prevent misunderstanding, we have added an *h* to a final *e*, which is to be pronounced as above indicated, and without the aspirate.

## APPENDIX B.

### HYPSOMETRICAL OBSERVATIONS MADE IN ASIA MINOR IN 1864.

THESE measurements were calculated by Professor Guyot's Tables, and were taken with an instrument made under his direction by Green of New York. Two thermometers were employed when necessary, but the one attached to the instrument was usually sufficient. The base employed was the level of the Black Sea, at Samsoun. All the observations were made between May 8th and September 5th.

LOCALITY.	ELEMENTS.		Heights in English feet.
	Barometer in English inches.	Thermometer, Fahr.	
Samsoun, 40 feet above sea (mean of six observations) .. .. .	30·040	58	..
Khan, 4 hrs. south of Samsoun ..	27·142	64·5	2886·57
Cavak (mean of three observations)	27·880	64	2135·60
Delinos Khan .. .. .	27·000	59	3002·78
Bekjilik, above ditto .. .. .	26·426	58	3569·86
Khan, 2 hrs. west of Amasia ..	28·362	76	1710·36
Amasia, Krug House .. .. .	28·246	74·75	1829·92
.. 12 feet above the river ..	28·498	74	1590·84
.. level of Yeshil Urmak ..	..	..	1578·84
Inebazar (mean of three observations)	27·311	73	2758·96
Toorkhal, 20 feet above the river ..	28·186	71	1862·04
.. level of Yeshil Urmak ..	..	..	1822·04
